What Readers Want to Know Questions on Crops, Fruit and Livestock

We have been told that sweet clover is a good pasture crop. How much seed is required to the acre?—M. J. H., New York.

If your permanent pasture is running out or needs improvement it may pay you to eliminate it and place the pasture in rotation. Not knowing your local conditions we cannot give you any definite advice in that respect.

Speaking of sweet clover as a pasture plant, Professor E. L. Worthen of the College of Agriculture says, "Biennial sweet clover is an excellent rotation pasture plant. The following rotation is typical: Corn, oats, sweet clover. The sweet clover planted with the oats lives over the winter after oat harvest and comes on the next season. Where it is successfully established; an acre will pasture a cow for the whole season and furnish her an abundance of feed. In this plan, the essentials for success with sweet clover are lime enough in the land to grow red clover well, twenty pounds an acre of scarified sweet clover seed, and inoculation where neither sweet clover nor alfalfa has been grown previously.

Comparing Lime Carriers

A week or so ago there was an article in the American Agriculturist about the kind of lime to buy. The writer said that a ton of ground limestone was equivalent to ABOUT half a ton of hydrate. What are the exact figures in this comparison.—N. J. K., New York.

A ton of ground limestone that analyses 54 per cent calcium oxide or 97 per cent calcium carbonate is equivalent to 1571 pounds of hydrate that analyses 70 per cent calcium oxide and this same ton of ground limestone is equivalent to 1384 pounds of burnt lime in bulk. These figures are taken from the Cornell Extension bulletin No. 78 entitled Liming New York Soils by Professor A. F. Gustafson.

Of course, in making your own application you will have to find out the percentages of the lime that you are using. Not all commercial limestones run as high as 54 per cent calcium oxide and not all hydrates run 70 per cent calcium oxide. Naturally if you had a limestone that did not analyse as much calcium oxide you would have to apply more in comparison to the same amount of hydrate. It is a good idea to consult your county agricultural agent if you are in doubt.

Rickets in Young Pigs

I have four young pigs about 6 months old and I do not know what is the matter with them. I have been feeding them a mixture of ground oats and oatmeal middlings. One of them got lame in the hind quarters sometime ago. When he was lying down and tried to get up it seemed to be most difficult for him. About a week after we first noticed he was lame he went lame in the forward part. He got so bad he finally walked on his knees and now he cannot walk at all. He eats all right. The others are showing signs of going the same way. What is wrong?—A. J. M., New York.

Undoubtedly your pigs are effected with rickets. This condition is similar to that which causes bow-legs in children. Error in feeding and management are usually the cause, although the tendency to the ailment is said to be hereditary.

In your case, undoubtedly it is caused by an improperly balanced ration. Ground oats are all right provided the hulls are screened out. The hulls irritate the membranes that line the intestines and may result in severe cases of piles.

It is very rare that we hear of rickets when milk is included in the pig's ration to say nothing of clover or alfalfa hay and oil meal and tankage. The latter dry feeds are best fed the hogs by means of self-feeders. If you have not a good supply of milk it is advisable to buy

powdered skim milk or semi-solid buttermilk.

Hogs Need Minerals

In addition to this the pigs should have access to a box of minerals, consisting of a mixture of ground limestone, salt, wood ashes, with a sprinkling of sulphur added. During the summer the hogs should have plenty of pasture.

In your specific case it would be well to physic each pig with Epsom salts added in the slop. Also add lime water. Those that are not seriously effected as yet may recover. It is doubtful about the one that is most seriously affected.

Trees Have Apple or Cedar Rust

I am enclosing apple tree leaves with spots caused by some insect. Can you tell what it is? Just two trees have them. The other trees are free from it, although those that have them are healthy.—H. C. Elmendorf, New York.

An examination of the apple leaves submitted shows the disease to be apple rust or cedar rust as it is sometimes called, caused by the fungus Gymnosporangium Juiperi-virginianae. This fungus attacks both the apple and the common red cedar. On the cedar it produces a swelling or gall called cedar apple. In the spring during wet weather, long gelatinous horns are sent out all over these cedar apples and from these gelatinous horns certain spores are produced which are blown about in the air. Those alighting on the leaves of certain varieties of apples bring about an infection having the appearance of the spots present on the specimens sent in. The fungus also is able to gain entrance to the fruit of the apple causing similar spots there, usually at the blossom end. Spores are produced in the affected spots on the apple and these are able to infect the cedar again. Both hosts are necessary for the completion of the life cycle of the fungus.

Spray and Plant Resistant Varieties

While applications of fungicides made at the critical time will prevent an infection on the apple trees, it is rather difficult to time these applications carefully enough to prevent the infection in general practice. The most successful results have been obtained by the eradication of the cedar in a zone about a mile wide about the orchard. If this is done there will be little infection and rust will be a negligible factor. Another control measure which should be given consideration in planting an orchard is the use of resistant varieties. York Imperial, Rome, Wealthy, Jonathan, and Ben Davis are particularly susceptible, while Baldwin, Yellow Newton, Maiden Blush, Stayman Winesap, Yellow Transparent and Arkansas are among the more resistant varieties.

Dynamite and Puller are Best

We have been informed that by boring stump and filling it with saltpeter, then plug the hole with wet clay, leaving it stay for six months and then light with kerosene that the saltpeter acts like a fuse and that the stump will burn to the roots.—C. F. D., New York.

We know of no experiments on this subject, but we have talked with men who have used the method outlined. It is claimed that saltpeter is carried through the stump by moisture during the six months interval between the placing of the saltpeter and the time of firing the stump. If the stump is thoroughly dry when burned the treatment is helpful. It is useless on either green stumps or wet stumps. As a matter of fact, if the stumps are not green, and are burned at the end of an extended dry spell, they will usually burn to the roots without any special treatment. The surest way of removing stumps is to use dynamite and a stump puller.

Harts' Seeds

Seeds for Home and Market Gardeners

High in quality, reasonable in price. Selected especially for gardeners who want the best vegetables for table and for trade.

Bountiful Stringless Beans

Absolutely stringless; remain tender and brittle longer than most sorts. A superb early and heavy producing Snap Bean for market.

Early Wonder Beet

An improved Crosby. Blood-red flesh; globe-shaped, medium-sized; small tops and tap roots. An extremely popular early and late market garden sort.

Our new Catalogue D listing seeds for market and home gardens is yours for the asking. Write today.

We Need Better Potatoes, Not More: New York's Program In Potato Marketing

E. V. HARDENBURG

RELATIVELY less study has been given the matter of efficiency in potato marketing than in potato production up to the present time. The need for more attention to this important phase of the industry is more apparent in a year of large production like 1924. The Department of Agricultural Economics at Cornell has made a careful analysis of the cost and methods involved in handling the potato crop of New York from the time it leaves the producer until it reaches the ultimate consumer. This department has had the excellent cooperation of many of the largest potato shippers and cooperative potato marketing organizations of western New York in making these studies possible.

A study of the actual costs of each of the necessary items involved in handling carlot shipments, as obtained from the records of these handling agencies during the past two years, has clearly demonstrated not only that potato marketing is necessarily expensive but also that a large part of the consumer's price has been and will continue to be justified.

Marginal Producer Partly Responsible

It is apparent that inefficiency in marketing methods is as common as inefficiency in production methods. A part of this inefficiency is, of course, traceable to the producer who has not had a proper appreciation and regard for the production of a more marketable product.

Potatoes of low quality are being produced principally by the average or marginal grower situated on soil poorly adapted to the production of bright-skinned, disease free and insect free tubers. Such growers have not been directly amenable to the influences and the teachings of the extension agencies. In general they have not responded even to the local county programs set up by the county agricultural agent. Yet it is well known that low quality potatoes have not been profitable to the shipper, the wholesaler, consumer, and least of all to the producer himself.

Local Shipper Can Help Situation

There remains but one agency which can both logically and effectively influence this marginal grower in a program of improvement. This agency is the local shipper. He above all others is in a position to demonstrate the real difference between marketable and unmarketable potatoes. The necessity for greater varietal standardization, better grading and seed improvement can be brought to bear by the shipper when the producer presents his product at the car door. The primary reason why this influence has not been effective in the past of a lack of cooperation between competing shippers and perhaps the necessity for a greater volume of business at the smaller loading points. Growers and Shippers School in Steuben County

With the object of establishing a better understanding and a more sympathetic viewpoint between the producers and local shippers in order to bring about a better market product and a more efficient potato marketing program, a series of potato marketing schools were recently conducted for growers and shippers in western New York by the College of Agriculture in cooperation with the Farm Bureau in Steuben County.

As a result of these meetings potato growers were perhaps more than ever impressed with the various necessary items of cost in the marketing of potato.

Treating muck soil for more profit

KNOWLEDGE is power! The more familiar you are with the needs of your soil—the better able you are to raise profitable yields from it. Muck soil was formerly regarded as waste, but now we know that good drainage and the right kind of fertilizer results in paying yields.

Muck soils are rich in nitrogen, organic matter, and sometimes phosphoric acid—but very poor in potash. Thus, the use of potash, either alone or in combination with other plant foods, is necessary for good crops on muck soil.

The Orange County Onion Company of New Hampton, N. Y., proved the value of potash by experimenting on four plots. One plot was not fertilized; another was fertilized with a mixture *without potash*; a third plot was fertilized with a complete mixture containing 10% Potash; and the last plot was fertilized with sulfate of potash alone.

Where sulfate of potash alone was used, the plot produced \$46.63 extra income—and where a complete mixture containing 10% potash was used, the plot produced \$111.88 extra income. In other words, when potash was left out, the above plots produced \$46.63 and \$111.88 less.

The New York Experiment Station is recommending 1000 to 2000 lbs. per acre of an 0-10-10 mixture for onions and potatoes on muck soil; and the same quantity of a 4-8-10 mixture for celery. Use potash on your muck soil this season.

EARL FERRIS NURSERY
735 Bridge St., Hamilton, Iowa

Yes, Sir!

It's more than a fertilizer—

YOU kill two birds with one stone when you fertilize your potato crop with Sulphate of Ammonia.

The Ammonia supplies that needed element—quick-acting nitrogen—the most effective crop-increaser in the world. And Sulphate stands for *sulphur*. Agricultural authorities agree that sulphur gives a control reaction *which checks the potato scab*.

Don't accept any alkaline source of ammonia in your potato fertilizer. Specify Sulphate of Ammonia, which—without costing one cent more—contains the ingredient that wipes out scab trouble.

Helpful bulletins—free

Knowledge as to the use of Arcadian Sulphate of Ammonia on various crops is yours for the asking. Fill out the coupon below and mail to our nearest office.

When Shall We Put On the Dormant Spray?

D. V. REVENBURGH

THE months of February and March are important ones for the orchardists but oftentimes they seem to have been neglected when the first day of spraying is at hand.

Seven years out of every ten in New York State, the time that the delayed dormant application on apples is most effective is rather short and the man with extensive plantings is often hard pressed to get his orchard covered in time. If he doesn't get it covered then he either has to let part of the orchard lie without the delayed dormant spray with the promise that it will be different next year or he has to dilute his mixture and go on with a subsequent loss in efficiency of rather expensive material. The usual reason for delays are failure to have the spray rig ready. The most men I have noticed who buy a new spray rig wait until the last moment to put in their order and then hector the local agent because there is a delay in delivery. The reason is that they are, buying the new rig is that the old one hopelessly played out on the last summer spray. If the new rig doesn't arrive in time, they will toggle up the old relic with doubtful success, or borrow their neighbor's after the proper time has elapsed and the owner is through with it, or they will sit still and let the scab, aphids, and scale get in their licks.

Order Your Supplies Early

It costs no more to get the order in early. Firms that deal in this sort of equipment have their greatest demand in the few spring weeks while at the same time transportation companies have some pretty heavy demands on their facilities to transport.

Where there is no new rig to buy, the old one should be gotten out in the barnyard on a warm day and the tank filled with water. By running the rig, engine troubles will be checked-up, new batteries can be installed, the pumps can be repacked the hose tested and replaced if necessary, the check valves examined, and the nozzles, guns, and other parts examined. Then one can wait the right time with assurance without having to run the risk of a balky engine, leaky valves, and the thousand and one things that make a spray rig a much cussed piece of machinery.

The Schedule Should Be Ready

It is high time that a spray schedule for the season was decided upon. The basis for this can be your experience in the past together with what showed up on your cull fruit last fall. The state departments, the local county farm bureaus, the state college of agriculture, and the New York State Experiment Station have the necessary information and assistance for anyone who is willing to ask for it in planning and carrying out a good concise spray program. In addition spray materials have to be purchased though in this fact, few orchardists fall down at the present time, due to our many cooperatives and the efforts of the fungicide salesmen.

There is also plenty of pruning to be done and every bright day when the temperature will permit will see a lot of this going on. The more that can be done early, the better and more effective work can be done against the insect and disease pests, while at the same time this will permit more ground being broken in the cultivated orchards a little later.

Many farm bureaus will be holding meetings at which fruit problems will be discussed. The public discussion of these problems is of benefit to all and the up-to-date orchardist misses none of these productive meetings. For those in the Hudson Valley, the eastern meeting of the New York Horticultural Society is being held at Poughkeepsie this week, which none should miss.

eties of grapes recently called to the attention of the fruit growers by the Experiment Station. The first of these is the Brockton which is a green grape suitable to home use or nearby markets. They will not stand transportation for very long distances but on the other hand cling well to the vine. The Ontario is also an excellent green grape for the home vineyard for an early variety. The Portland has proven itself an excellent green grape for the early market. Its size and season are its best characteristics. The fourth variety is the Ripley, coming into season about the same time as Niagara but with superior handling characteristics together with excellent palatability.

Moore's Early Is A Valuable Grape

THE Moore's Early is one of the most profitable grapes to grow on the farm where the marketing of a surplus at a good price is desirable while the heavy marketing of grapes is not attempted. The fruit is large and ripens two weeks before the main crop of grapes come into the market, making them sell for half more money. A friend this year sold all the Moore's Early he could supply for six cents a pound and the demand far exceeded the supply, and even after the other grapes came in people asked for them for they were finer than any other sort in the vineyard this year, the later sorts being loose in the bunch and below average size, while Moore's Early was compact and large berried.

* * *

Young Blackberry Plants Best

THIS year a friend here set a nice blackberry patch of the old plants with several canes in the clump, expecting to

get some fruit, but was disappointed in that and the growth of the plants was not satisfactory. A neighbor had tried both old roots and young sprouts of one year's growth and while the old roots grew and bore fairly well after the first year the young plants made finer bushes and bore better, and the old plants never did overcome the handicap of the transplanting and gave place to new young plants the fourth year, and that man says he will never again set anything but the young plants. There is less root disturbance and the roots are better balanced on the young plants and take hold of the soil and spread more evenly, making a much thriftier and hardier bush. * * *

Shaping Heads of Plum Trees

PLUMS grow very differently in form of tree and to get the trees shaped to bear good crops safely and to have the fruit easily picked we should prune with that end in view. The Burbank especially will need special pruning, for it sends out the branches almost horizontal and when they grow long and are loaded they break down badly. The branches should be pruned back closely every winter and the new growth in the spring should be encouraged to go upward as much as possible, for it will spread enough at best. The October Purple on the other hand runs up too much and the cutting back should aim at a low head and spreading the branches outward. The stronger new growth is out next to where cut back so to leave the last bud the way you want the main growth is best.—L. H. COBB.

We Need Better Potatoes

(Continued from Page 211)

atoes, which in turn affords a greater appreciation of the necessity for the

production of a higher grade product. In general the margin of profit to the producer varies with the quality of his product. Not until the shippers cooperate in demanding better graded potatoes, produced under soil and climatic conditions resulting in tubers of bright skin and freedom from blemish, will the marginal grower cease to waste his energies under conditions entirely unsuited to potato production.

Better Potatoes, Not More

Our markets today do NOT need MORE potatoes, BUT BETTER POTATOES. Since we have been faced with over-production of potatoes in recent years, our markets have been able to refuse any but the best grade. *It has been shown that per capita consumption does not increase because of low price.* To stabilize production means a reduction in acreage or an increase in consumption. Apparently CONSUMPTION CAN BE INCREASED ONLY BY AN INCREASE IN MARKET QUALITY. Until the time when land values become higher or the wage level relatively lower, the New York potato crop should be produced only under soil and weather conditions best suited to this crop.

These are the essential ideas and this the principal program in which the extension agencies are now attempting to cooperate with both the producer and the marketing agencies in New York.

"The AMERICAN AGRICULTURIST certainly is a fine magazine. I do not know what I would do without it. It is one of the best magazines I have read".—Myron Ashline, Rouses Point, N. Y.

ACME Hand Potato Planters

The "Acme" plants them deep, fast as you can walk, and without packing the soil—the cheapest and best way to plant potatoes.

All Practical Styles

Strong, Neat and they Work Right

Years of experience have taught us what the farmer needs in planters. Every practical style is found in the "Acme" line and each style made in the best way—first class material, first class workmanship. You'll never be disappointed in an "Acme" tool. Insist on an "Acme" when you go to your dealer.

Dr. Hess Stock Tonic

A Cow Tonic and Regulator

Your cow is a machine. To convert your grain, hay, silage and fodder into pails of milk is her function. The more she eats each day, if she is able to digest it, the more milk you get.

Dr. Hess Stock Tonic contains the dairyman's favorite remedy, Nux Vomica—the greatest of all nerve tonics—cow remedy, appetizer and digester. It contains Quassia, a stomach tonic; whets the appetite, promotes digestion. It contains Diuretics, to keep the kidneys active. It contains Laxatives, to keep the bowels regular, so that there is no clogging of the system during heavy feeding.

Just regular milk giving where Dr. Hess Stock Tonic is included in the ration.

Excellent for cows at calving time. No retained afterbirth. Feed it before freshing. Good alike for all cattle.

Buy it by
the pail

Costs Little to Use

The price of one gallon of milk tonics a cow for two weeks. 25-lb. pail, \$2.25; 100-lb. drum, \$8.00 (Except in the far West, South and Canada)

Why Cream Tests Vary

Other Problems That Are Bothering Dairymen

FORMERLY we were often greatly surprised at the variation in the test reported by the creamery to which we sold our cream. We found that in the early part of the summer the trend of the test was downward. We should not assume that a variation in the test means either carelessness or dishonesty on the part of the cream buyer. There are several factors which affect the richness of cream, and which make a variation in the test from time to time.

First of all, the richness of the cream varies with the richness of the milk. In early spring and summer there are more fresh cows which results in lower testing milk and as a result of this the cream goes down in proportion. A herd of cows may produce milk averaging four percent. in the fall and in the early spring and summer the average will run as low as three and six-tenths percent. This much difference in the milk will cause a variation in the cream test, usually running from five to eight percent.

Separator is Important

The next most important cause for variation I have found is the speed of the separator. The faster the separator is run the larger the proportion of the skim milk and the smaller the proportion of the cream. Consequently the high speed yields a richer cream. If a machine that is supposed to be turned sixty revolutions a minute is reduced to forty the cream will also be considerably lower in test.

Another important cause of variation in cream tests, and sometimes the most important is the amount of water or skim milk used in flushing out the bowl. The difference of a pint used will make a noticeable difference in the test of the cream.

A difference in the temperature of the milk separated will also have some effect. Some separators are more sensitive to temperature than others. With some a difference of twenty degrees in the temperature of the milk when separated will make a difference of several percent. in the test without affecting the thoroughness of the separation to any marked extent. It should be understood that these variations occur not as result of more or less loss of fat in the skim milk but as a result of the larger proportion being taken out in the form of cream.—W. E. Farver.

When We Figure It Up

I WAS doing a little figuring this morning and the results arrived at were a bit surprising, and more than a trifle startling. I started out with the fact that every hour a man works on the farm is, at present prices, worth forty cents. That is what we have to pay when we get a man to do any kind of farm work.

Suppose I have at the barn just one cow that does not give milk enough, of a good quality enough, to pay her way. I have had her tested so that I know she is a beggar. But I keep her. This may be her fourth year, which by many farmers is considered a cow's poorest year. "Next year", so I say, "she may do better." But I know well enough that this is a doubtful proposition. If a cow is ever going to pay her way, she will when she reaches the age of four years.

When I go to the barn in the morning, I spend at least ten minutes milking, and stripping, that cow. I try to get the last drop so that there may not be quite as heavy a loss as there would be if I shortened up the process of milking. Ten minutes is one-sixth of an hour. Call it six cents. Really it is more than that, but to give us even figures say cents.

If I do my duty by my cows I spend another five minutes grooming my boarder cow. Three cents more. It takes me three minutes to get down hay and ensilage and grain for this cow. Two cents more. In cleaning the stable, letting the cow out and watering her I shall spend five minutes more, adding three cents to my bill of expense for the day. It is my habit to let my cows out in the middle of the day, to drink and get the fresh air, putting them in again and feeding them hay again. This adds five cents to my account. In the afternoon I let my cows out again for another drink and outing, after which I clean the stables again and bed the cows down for the night. Here goes another five cents, to which must be added six cents more for the evening milking. This foots up thirty cents for the work I do every day for this cow that I know beyond a shadow of doubt does not return me the cost of her feed any day in the year.

I have purposely left out all account of the cost of the feed I give this beggar cow, because if I did not have her I would have a better cow in her place, one that would eat no more, but which would bring me in a profit every day. In the course of the year there will be many days when I shall do work worth more than the thirty cents a day. When she brings in her calf, for example, or when she is sick and must be waited upon. If I am compelled to summon a veterinarian, that means a large increase; but I leave all those things out, and I think any man that knows anything about the dairy business will agree that I have placed my estimate of thirty cents a day plenty low enough for the winter months. This figures up to \$2.10 for every month this cow is in the stable.

Surely Worth as Much as Hired Man

In our part of the country we must stable our cows not less than six months of the year. Multiply \$2.10 by six and we have \$12.60, the actual worth of the work I put on this profitless cow during the winter months. Cut these figures in two for the summer months and call it 15 cents a day, or \$1.05 a month. For four months we have \$4.20, making a sum total of \$16.80. My cow will probably be dry the other two months of the year, and here I find my entire cost of caring for this cow each year. If I hire a man to do it for me, this is what I pay out in actual money for the sake of harboring this worthless cow, and I think my time ought to be worth as much as that of a hired man.

Probably I have more than one such cow in my herd. The more I have, the more it costs me to run my dairy. And it looks to me now as if I could not afford it. This cow ought to be taken out and shot! She is my enemy. She not only robs me but she occupies the place a good cow ought to be in. Boys, bring out the rifle! We will have a shooting match!—E. L. Vincent.

Grain for the Calf

WHEN skim milk is substituted for whole milk in feeding the calf something needs to be added to replace the butterfat removed in the cream. Corn can be used to good advantage, I have found. It is really better well cracked than to have it ground too fine. Bran is very good and I find ground oats splendid. I prefer a mixture far above any one of those named. The calf will begin to eat feed when two or three weeks old. It should have free access to feed from this age on. The best way to feed grain, I have found from experience, is to feed it dry, and

\$25 Down Buys Holstein Bull

A Grandson of
Dutchland Colantha Sir Inka
And
Hengerveld De Kol

This young bull enhances the blood of extremely large producing and transmitting animals from every side of his pedigree. In long time, as well as short time work. The sire has a very exceptional list of large producing daughters, and he is from a 30-lb. four year old daughter of Dutchland Colantha Sir Inka, the greatest transmitting son of Colantha Johanna Lad. The dam has a 21-lb. three year old record, and her sire is from a 30-lb. four year old.

of it to remain in the corners of the feeding box as it will sour and may cause digestive troubles. Boiled ground flaxseed is also used with skim milk to make up for the fat removed.—Orlando Scheneman.

Certified Milk Producers Meet

H. E. Cook

THE Metropolitan Certified Milk Producers, Inc. held its annual meet-care should be taken not to allow any ing at the Hotel Biltmore, New York City, Monday, February 9, with an attendance of 52. Edwin P. Brown is president and Mr. Seth W. Shoemaker, secretary-treasurer. This Association not only functions as a gathering time for the discussion of questions pertaining to certified milk but also for advertising purposes. It was said that the percentage of increase in the use of certified milk in the metropolitan area was greater than that of B milk during the past year. At this meeting were represented milk commissions, county medical societies, boards of health, owners and managers of certified farms, and distributors, everyone equally interested in better milk, lower costs and increased sales,—a splendid lesson to find one class of milk being guided, produced and handled by different groups of men working together for the common good.

While there was some difference of opinion as to the proper fat content, it was voted that approximately four percent butter fat for commercial certified was best adapted to child feeding. Methods for mixing the milk each day in order to send out a uniform butter fat and total solids content received a good deal of attention that the child might not be fed poor milk one day and rich milk the next day.

Prof. G. M. Cavanaugh of Cornell gave the results of some recent experiments in milk analysis showing that green summer feed produced more vitamins in the milk than the dried feeds commonly fed in the winter.

Mr. Brown in his opening address stressed the importance of looking after the everyday small details as the most important matter before producers at the present to which all agreed. The writer would stress the importance of the outstanding lesson of this gathering to farm producers everywhere, of all parties concerned working harmoniously together.

Cancellations Light

The better League prices, taken together with the League's recent change of policy is evidently encouraging the members to stay with the organization, for at the date that this is written—February 16—there have been only 29 League contracts cancelled since the beginning of the cancellation period on February 12th. And there have been received more applications for contracts than there have been cancellations.

Hawley-Murphy Sale Definitely Set for March 25

The severe storm that visited New York State on January 23rd so completely crippled traffic and communication in general that it was best to postpone the Hawley-Murphy Dispersal Sale at Liverpool to a later date. We have been advised by S. T. Wood, who will be in the "box" at the sale, that it has now been definitely scheduled for March 25th. The sale also includes good consignments from herds of R. C. Melvin, W. H. Crowell, John Haner and Grove Goodwin. This includes Empire Segis, a proven son of King Joh, out of a 33-pound daughter of King Lyons. It also includes the herd sire King Julius Lyons, a son of King Lyons from the largest record daughter of King Segis—a 35 pound cow.

Another famous individual will be Highland Burke Joh the great 40-pound four-year-old. The sale will be held in a heated pavilion near Stop 20 on the Liverpool trolley from Syracuse. The reason for the sale is that the farm is to be cut up for suburban real estate.

Always

The Same Formula

The Same Feed

The Larro formula will never be changed, regardless of the cost of ingredients, until a better one has been found and proved. When a feed formula is changed you have a different feed, untried and unknown. The Larro formula has been developed by years of experiment and practical feeding tests, which have demonstrated that it will economically produce the most milk and keep cows in good condition and in good health. Any change, therefore, however slight, would cost you, the dairyman, both milk and money, unless the same exhaustive tests had first proved the new formula superior.

The best feeding stuffs that can be bought are seldom twice alike. They may look much the same, but they're not. Each ingredient in

Larro is first brought to an exact standard of chemical composition, moisture, taste, smell, bulk and color, before it is ready to use; then it is accurately weighed into the mixture. The amount of each ingredient per ton of feed never changes. The result is always the same feed—no matter where you buy it, or when. This uniformity is your guarantee of profitable production, *always*, from any cow that has the capacity to produce milk profitably.

GRANGERS TRIPLE PURPOSE GRIT

WILL MAKE YOUR HENS LAY MORE EGGS

It is sharp and clean, and absolutely the best substance that can be procured for grinding the chicken's food in the gizzard, and thus aiding digestion, and it is so white that there is no waste, as the chicken finds and gets it all.

NO NEED FOR OYSTER SHELLS

GRANGERS TRIPLE PURPOSE GRIT is superior as a shell-maker. It produces uniformly hard shells that will not break easily, and does away with any need of oyster-shell, magnesium, or any other such materials fed for shell-making.

BALANCES THE RATION—INSURES DIGESTION

GRANGERS TRIPLE PURPOSE GRIT has a definite mineral content of Sulphur, Carbohydrates, etc., which gives the proper balance to the food required by both chicks and adult birds to keep them in good health, and enable the chickens to produce the best eggs and more of them.

GRANGERS MFG. CO., Box 1002, Hartford, Conn.

February Chicken Chatter

Early Chicks Need More Care But They Pay

EARLY chickens require a little more care and attention than the later ones, but poultrymen agree that chicks hatched by the second week in March or earlier are the ones that are profit-producers. The first thing to be considered is the vigor of the breeding stock. The average farm flock fed for production will not give a high percentage of hatchable eggs in February. It is necessary to give the breeders different care. I have found that chicks hatched in March are all right for the breeding pens the next year. Pullets hatched at this time should begin laying in good shape by the first of September and after laying five months or more they are fully matured birds. However, it is a fact that such birds do not produce as many hatchable eggs as the eldred birds, so, I think the poultryman who wants early chicks and desires to build up his strain of layers, will find it important to keep old birds for breeders. If pullets are used, they should be the very early ones and they should be allowed to moult and have a period of rest after the first of December. I would not advocate that pullets be used year after year, anyway, but they might be all right on alternate years.

Cheaper To Buy Baby Chicks Of Good Matings

In my pens, where heavy production is the object sought, rather than the building up of a fancy flock, I find it cheaper to buy baby chicks. One can do this and still keep a small flock of breeders for later years. Thus the strain can be improved.

If early hatching is done, it must of course, be done by artificial means. An incubator is easier to handle in February than in May. There are not so many changes in temperature. Put the machine down cellar if the ventilation is good. If not it will give good results in any unheated room. Keep the eggs from chilling before they are placed in the machine and then follow directions. Any incubator that is worthy of the name is very easy to handle.

Be sure the equipment for breeding is right before the chicks come off. You must have a tight house and at the same time one that is well ventilated. It is also important that an outside scratching pen be provided. Little chicks should have access to the ground even in the coldest weather.

A Shed That Filled The Bill

I have recently seen a brooder house that seems to fill the bill. The building faces the southeast and holds a canopy brooder large enough to accommodate 500 chicks. Windows allow the sun to enter, the first thing in the morning. On the west side of the house a scratching shed is built with open front. As early as the sun shines into this shed the chicks are allowed to run out for scratching. They will get the sun for some six hours a day and they can run back to the warmth as often as they wish. I have shovelled the snow away in front of the house and allowed the little fellows to run outside even upon

the snow and it does not harm them. However, a good covered scratching shed is one of the first things to consider when building a brooder house. As to brooders, small flocks may be handled with ordinary lamp-heated hovers, but flocks of a hundred or more require coal or oil burners with automatic heat control. Even with these, watchful care is required, for a sudden change of temperature or the coming of a strong wind may give a drop in the heat that will be disastrous.

Cod-liver oil has been tried out for leg weakness and seems to have a very beneficial effect. At the same time, I believe a chance to run upon the earth is almost indispensable. It is true that chicks are raised without any chance to run upon the earth but it is much easier to keep them in good health if ground is available.—Charles H. Chesley.

Some Points I Watch During Late Winter

ONE reads a lot of directions just now for the health and comfort of poultry during the long winter months. Here are a few more that I find are worth trying. Straw laid along under the roof, supported on rails, boards or planks, at least two or three inches apart from one another, makes for both warmth and ventilation. Without it, the fowls would be much colder, combs would be badly frozen and egg-laying decreased.

If troughs for feeding are not supplied with lids, a good plan is to have them raised off the ground a bit, so that litter and droppings will not be easily kicked into them. If there are not a sufficient number of small water pails and basins have to be used, it will be found worth while to place them on the top of two or three pieces of board or a platform. I find this helps to keep both water and milk much cleaner. Those who can afford to buy the proper drinking fountains have no need of these hints of course.

Where one has a fair-sized flock, say of from seventy upwards, it pays to have several small pails or basins, instead of just one large pail or large basin for the liquids. The older hens and pullets are apt to peck at and drive away any younger and more timid birds from the needed refreshing drink. Where several smaller dishes are supplied, each has its own little group of fowls around it and all have a fairer chance.

Feed The Mash In Several Troughs

For the same reason besides troughs, I use some thick pieces of board and when I feed the wet mash, put several large spoonfuls of it on each board as well as in the troughs. Had I more troughs I would not require the boards of course. Then, all have a more equal chance of getting a good dinner, from the oldest down to the youngest.

In my mash, besides bran, cornmeal, middlings and boiled potatoes, I also always have chopped raw potato peelings. My birds are never ill and I attribute this partly to the vitamins in the peelings, for we all know the best part of the potato is next the skin. For variety I often also add chopped carrots or beets, or cabbage—all, of course, raw. The whole is mixed with the boiling salted water, drained off our own dinner potatoes.

Milk In Any Form is Good

In winter and spring, a little good, dry mustard is put in the mash—just a good pinch of it, say for fifty birds. This helps to prevent chills or rheumatism. Dry mash, with a little fine salt well sifted through it and sliced turnips stuck on nails add variety to the diet. I cannot afford beef-scrap, but have always plenty of milk,

(Continued from page 224)

Unadilla Silos are Dependable

Dairy owners know from experience that Unadilla Silos will keep their silage in the best possible condition. They know they can depend on their Unadillas year after year, because of their sturdy construction. They are air tight, water tight, frost resisting and weather defying.

\$25 Per Ewe

The Lincoln-Rambouillet Cross

THE term "Golden Hoof" is no misnomer for a flock of

By Mark J. Smith

flock of sheep meant a great deal to him. He knew what they

had cost him in work and study. They were not a registered flock but developed for utility—for size, form and fleece.

A Calendar of Endeavors and Achievements

Roy Dunton's 66 ewes brought him in a total of \$1666.40. The ewes are range-bred known as the Lincoln-Rambouillet cross. Rambouillet rams were used and the lambs were dropped about the middle of April. Mr. Dunton raised 97 lambs from the 66 ewes, which fact speaks well for the prolificacy of this cross bred type of sheep.

Twenty-two of the top lambs were sold in September—averaging a little better than 83 pounds per head, bringing in \$219.60. The remaining 75 head of lambs were fed until December 20th, when they averaged 110 pounds with ten pounds over on the lot to spare. These lambs brought 14 cents a pound or \$1156.40, making a total of \$1376.00 as income from the sale of lambs. The wool brought \$290.40, making \$1666.40 as total receipts. Over \$25.00 per ewe.

It is of interest to know how these ewes were handled—a man who can accomplish a feat such as this with a flock of ewes is entitled to an audience. He says:

"These ewes were handled in a general farm way—during the winter months they ate bean-straw, clover hay and with no grain other than cull beans up until two weeks prior to lambing when they were fed plenty of oats and barley. During the summer they were given a change of pasture every two weeks, and I have never had any stomach worm trouble."

Apparently, Mr. Dunton is a member of that school of sheepmen of which A. T. Gamber, the widely known sheep breeder and exporter is a member. A young man was buying some foundation ewes of Mr. Gamber and being anxious to do well with them, said, "Mr. Gamber, what must I do with these ewes to succeed?" Mr. Gamber replied, "Feed 'em."

The Fellowship That Grows Between Shepherd and Flock

DURING a discussion of sheep husbandry problems at a meeting held several years ago at Wyoming, N. Y., Fred Clark made a statement that impressed me greatly. We were discussing the practice of buying western ewes, selling all the lambs, and ultimately sending the ewes to the market and buying a new lot. Mr. Clark said that it seemed to him that under such a system a man was losing one of the finest things in sheep industry—namely the fellowship that grows up between the members of the flock and the man who is building up a flock by the selection and saving of his ewe lambs.

Since that time in working with hundreds of sheepmen I have come to admire the type of sheepmen who is in the sheep business to stay and who is building up a flock that in future years will render him a great service. Such men are getting much more than money out of their sheep, for to them sheep husbandry is a life as well as a means of making money.

I shall never forget what O. C. Roby of Rocheport, Mo., said to me as he was showing me his flock of 300 ewes that represented the results of a life time with sheep—starting with them first in Ohio and later moving to the Missouri River valley. I very admiringly said, "They are mighty fine, Mr. Roby" and his reply was, "I know they are fine and I am just as proud of the fact that I know what I have here as I am of the sheep." This highly developed

had cost him in work and study. They were not a registered flock but developed for utility—for size, form and fleece.

I have before me a letter and a little book of wool samples from a sheepman living near Mansfield, Ohio. They were sent to me after I had attended a meeting in his section. The fact that had impressed me in the continuity of his endeavors. A calendar in the little account book bears the date of 1887. In the letter he says "the first ten samples of wool are from our present flock of sheep—about 100 head—the rest or in the back part of the book are what we used to have 10 to 20 years ago". He further says "You made the statement that the sire is half the flock and that you would go further and say a good ram is three-quarters of the flock—my experience has been that this is correct".

Such a letter as this one, although of only one page, says a great deal between the lines of sustained thought and effort in developing a better flock of sheep for as he says:

"I love to improve and my observation, if correct, is as I have told those I talked with, that if everything we bred would be an ideal, any fool could go in the breeding business".

Old Timers Again In the Saddle In New York

THE slump in dairy products and the revised interest in sheep was clearly seen in the increased attendance and interest shown at the annual meeting of the New York State Sheep Breeders Association, which has had an existence for over 90 years, being originally formed as a Merino Breeders Association in the early thirties.

The meeting this year was held in Rochester. At the election of officers, J. C. Duncan of Lewiston, was elected president, A. L. Hutchings of Coldwater, vice president, and F. E. Dawley of Fayetteville, secretary.

A balance of \$60 was reported on hand, and resolutions were adopted, covering many matters of interest to sheep men. A summer meeting with perhaps a shearing is being considered. All New York State breeders should join the Association and help to boost the industry.

Dogs And Sheep

YOU do not read so much these days about the dogs killing sheep. More and more are farmers keeping dogs of the better breeds and these are seldom sheep killers. They soon learn to protect rather than destroy anything that belongs to man, and instinctively wage war on curs that do attempt to destroy stock. From being a difficult matter to keep a flock in a pasture without having many chased to death by dogs, I have yet to know of a flock so injured now for several years and I seldom read of much damage even in journals from regular sheep raising districts. The Collie and Airedale have become so popular as farm dogs and are so dependable in all ways that few curs comparatively are given their keep on farms generally.—LEWIS HILLARA.

First Aid to Farm Animals

There are very few books published that may be consulted for treating the disease and ailments of farm animals. One of the best we have seen in a long time is that by Dr. J. L. Leonard and published by Harper Bros. entitled First Aid to Farm Animals.

Why Craine Silos Are Used by the Largest Dairies

Because they are strong, durable and economical, and make the best quality of silage year after year without attention or repairs.

Craine Silos are found on the largest and finest dairy farms in the country. Walker-Gordon Laboratory Company Farms and Sheffield Farms each with over forty Craines and Craine-Lox Rebuilt Silos. Borden Farms and Federal, State, County and Township institutions are large users of Craine Silos.

These buyers do not make their investments in Silos on guess work. They know that Craine Silos will make better silage and cost less in the end.

For these same reasons it will pay you to own a Craine.

Built best, cost less. Get our catalog. It's a Silo book that will prove interesting and of real value to you. Write today.

CRAINE SILO COMPANY, Inc., Box No. 120 Norwich, N. Y.

CRAINE TRIPLE WALL SILOS

THE SILOS OF GIANT STRENGTH

BIG 'C' LINE

'Ruff Shod'
Comfortable because it fits—satisfactory because it wears. Wears and fits better because made on Converse foot-shape last. No break at instep—no shucking up and down at the heel. Extension sole and "Stubgard" toe prevents snagging or scuffing. Don't accept a substitute. Get the best! Insist on the White Tire Sole with the Big "C".

Ask Your Dealer He is glad to show you Big "C" Line footwear. Try on a pair—or write for circular and give dealer's name.

The White Top Band and the Big "C" on the White Tire Sole protect you against imitations.

Big "C" Line footwear is sold at the lowest price possible considering quality. "Something just as good" can't be sold for less.

S NOW and more snow! And then a January thaw, two weeks late, which effectively cleared the roads and lowered the snow level in the fields. There are still six to eight inches of snow in the fields and orchards and many of the low flat areas are covered with water now frozen. There may be some injury to wheat from the ice.

We have had a lot more sunshine in February so far, and the fine days have stimulated the desire to get after the spring work. So we have been busy with the big job of pruning all day today. This is a long hard job for those who have large orchards and do thorough work. As a rule we do not get over all the orchards each year, but do a third to a half well each year. One large grower is doing little or no pruning at all this year on account of the cost.

Farmers' Week Well Attended

A short visit to Farmers Week at Cornell found about the usual crowd there in spite of bad roads and weather. The meeting of old acquaintances again, the conferences, the informing lectures are an inspiration. They freshen up our information viewpoints, renew our faith and courage in farming and start us off on another year's work with resolutions to do better work and live a fuller farm life. There seemed to be a rather larger proportion of women this year.

Farm Bureau Situation Much Discussed

I hear a good deal of comment on every side on the Farm Bureau membership situation. These county associations are apparently experiencing continued difficulty and discouragement in getting the quota of membership they have budgeted. This is not a new problem but an old one, perhaps cumulatively more difficult. Nor is it a problem peculiar to Farm Bureaus. The voluntary membership association devoted to educational or public improvement with a fee and without definite direct and annual cash or commercial benefits has always had, and probably always will have, a problem to maintain its membership. This is true of Chambers of Commerce, of Agricultural Societies (fairs), of local improvement clubs,—it is even true of churches. And the Grange with its important and direct insurance benefits is experiencing annual losses though these are small.

To many this continued loss of membership is discouraging. To a few of the narrower visioned and the easily defeated it is an excuse for talking about abandoning paid membership. To the enemies of the movement it is the occasion for attack. The demagogue with his usual courage is jumping on the organization when he thinks it is down. The real wonder is that 20,000 or more farmers continue loyally and enthusiastically to support the bureaus with their interest and their money in the face of their present economic distress. Where are there 55 other voluntary membership improvement organizations with dues of from three to five dollars that average 500 members each?

"It is Living Vigorously"

The voluntary membership association of farmers as a partner with government in the management and direction of adult agricultural education and improvement is sound in theory, works in practice and will endure. It fosters local initiative, stimulates local pride and effort, protects alike from political influence and government red tape and inefficiency, and successfully combines science with practice. If it is sound in principle and right in practice, it will live. And it is living vigorously right

now. Never were the county programs of work and the results from them better or more useful. Never were there a larger number or a more intelligent group of local committeemen and leaders carrying forward these programs. And everybody knows that the county agents are a virile lot of young men.

There are those who urge a universal lowering of the membership fee to two or at most three dollars as a solution of the problem. This may be a good thing; but it is not a fundamental cause of the decline in membership though it may be a contributing cause. It will not restore the old number of members, though it will probably help to do so. If the membership fee is lowered the fees to the State and National Federations should be cut accordingly. The programs of these organizations need revitalizing if not, challenging, anyway, and this is good time to do it. They must economize and they must do more that is vital to farmers—e. g. put on a vigorous tax reduction program.—M. C. Burritt.

Southern Tier Towns Flooded

ON February 7, snow averaged about 4 feet deep on the level. The warm temperature of a few days thereafter and rain on the 11th caused the Susquehanna River to rise on the 12th to the 16 foot high water mark. The ice went out the evening previous. The Owego creek showed the most rapid rise and all the lowlands between Owego and Richford were more or less inundated—water higher than in several years.

The Wilmott bridge over the Catawunk creek went out with the jam of ice and colliding with the bridge at the Andrews Mill site (over the Owego creek) taking a portion of that bridge out. Water ran through the plant of the Owego Bridge and Iron Company forcing 75 men to quit work on the 11th and the 12th.

A cold snap the morning of the 12th caused a cessation of the flood.

Cannawanna is all under water, including the fair grounds and water is from 5 to 10 feet deep on the lowlands around the old Red Mills on the Owego creek which with its branches are all bank full.

The new \$300,000 High School building in Owego will be dedicated today the 13th. It is standing the test of the high water in the concrete work, as not one drop of water has percolated through, indicating that it is perfectly sealed.

Three railroad bridges were washed out on the Lehigh Valley between Owego and Auburn. Only passenger trains are being run over this division. The trains run to the washouts where passengers are transferred to other trains.

The Tioga County Fair grounds at Owego which were recently purchased by Charles Marvin and presented to that village for a playground, has now a "Play ground Commission" consisting of five prominent citizens, who are organizing for business. All are unanimous of having plans adopted for its development that will be comprehensive. Their first move will be to obtain photos of the fair grounds from every angle (about 19 acres of land) after which an expert will be selected to lay out a playground, and that when said grounds are laid out the work will be so complete that a fifty-year programme of improvement can be accomplished without making any changes whatever. Of course, the grounds are to be used by the Agricultural Society of Tioga County for their yearly fairs, etc., as they may see fit.

Potatoes are picking up somewhat. Dean and Dutcher of Owego loaded

three cars the 7th at 40 cents a bushel. The roofs of several large buildings in different parts of the county collapsed from their great weight of snow, causing considerable damage but no loss of life. Now the snow is nearly all gone. Traveling bad.

A large flock of wild geese were seen this week, estimated at 200, and circling around over the Susquehanna apparently leaderless. I have heard my father relate that in his boyhood a flock of wild geese were passing southward (over Anderson hill in the Town of Candor) and one goose flew down into their barn yard, with their geese, presumably being tired out. It staid there all winter and acted as tame as any one of them. But when in the spring, a certain flock of wild geese were going northward, she flew up and away with them. Grandfather then regretted that he had not clipped her wing. But when fall came and the geese were again wending southward, she, with ten grown goslings left the flock and flew down in his barnyard. Then he clipped their wings. But me thinks he ought not to have clipped her's. Perhaps she might have repeated the annual flitting.—Mrs. C. A. B.

Lewis County Notes

CHARLES L. STILES

THE recent thaw and breakup has been a great boon to the farmers who in many instances were compelled to draw water for their stock but now the streams and springs have become greatly swollen and it looks as though there would be a plentiful supply of water for quite some time to come.

The Black River line of the New York Central has been quite seriously handicapped during the recent thaw, the roadbed having been inundated in several places and in some instances trains have been preceded by gasoline speeders carrying a squad of section men on the lookout for washouts but at the present time no serious damage has resulted.

Not much activity is being shown in the potato market, one local groceryman having the chance to place 150 bushels, called up a customer to engage the same and was soon after besieged with telephone calls offering tubers in quantities of 100 to several hundred bushels at 50 cents per bushel.

BUTTER A LITTLE BETTER

The butter situation is slightly better than it was last week. Prices have improved to the extent of 2 cents per pound and the situation shows a little more optimistic feeling on the part of the trade. Consumption of butter is very satisfactory. There is a very good out of town demand for storage stock which have reduced materially during the past month and a half. These facts, added to the rather restricted receipts of fresh stock have been responsible for a much better feeling all around. Creamery extras scoring 92 are worth 41c while other scores graduate down to as low as 34c.

CHEESE PRICES MAINTAINED

Cheese prices are fully maintained compared to last week. The fanciest held whole milk State flats are still worth from 25½ to 26c, with 25c representing the price for average run goods. Although trade is quiet, nevertheless there is enough demand for fancy held cheese to maintain the firm situation. The market on fresh cheese is not quite as strong. There is enough trading going on to maintain the quotations of 24c on fancy and 23c on average runs, with undergrades reaching 21c.

EGGS SLIGHTLY LOWER

The downward trend in the egg market continues. There are a number of factors that are responsible for this and undoubtedly will continue to be responsible for further reductions. The main things receipts are rapidly increasing and to avoid accumulations which would undoubtedly entail later losses, operators are making price concessions in order to keep stock moving. In addition to heavy receipts the situation in the market with regards to the Pacific Coast whites has a decided effect. Pacific Coast whites have been arriving quite freely, and in the face of the weak market prices have tumbled and these prices immediately reflect on prices of nearby whites. Fanciest nearby henery whites are now worth 47½ to 48c with lower grades working down to 44c for ordinary nearby firsts. Gathered whites are worth anywhere from 42 to 46c and pullets are bringing from 41 to 42c. Fancy brown eggs are fully on par with white eggs.

In many instances country prices are still above the New York market; and producers will, under these conditions, find that it will pay in the end to sell locally.

LIVE POULTRY BETTER

The situation in the live poultry market is better than it was last week. Receipts have been fully up to the mark. In fact, last week we had the heaviest freight receipts since the embargo was declared. The difference comes in the improvement in the consuming trade.

Fancy fowls have been bringing as much as 33c for strictly choice lots and have been working out freely. Leghorns are worth around 27 or 28c. Chickens have also been working out well, particularly fancy marks, reaching as high as 35c. A lot of chickens coming in are staggy and naturally this cuts prices to as low as 22c.

March 10 is the Jewish holiday, Purim, when fat fowls and hen turkeys are most in demand. Poultry shippers who plan to hit this market should so time their shipments that they will arrive in New York on Thursday, March 5, and not later than noon of Friday, March 6.

NO CHANGE IN POTATOES

On February 18, the New York market was weak and indications on that day were that the trend was downward. \$1.90 was being offered for real fancy potatoes in 150 pound sacks delivered in New York City. Where the quality of a shipment was unknown the best price available was \$1.75. Shippers were asking \$1.20 for potatoes per hundred in bulk with \$1.10 offered (and in some cases accepted). Something might happen to change the situation temporarily, such as a severe storm, but there are so many potatoes being offered to the trade that the buyers are simply sitting tight.

NOCHANGE IN BEANS

There is practically no change in the bean market. The situation remains prac-

tically identical to report as that of last week. For pea beans \$7.25 is about top with most sales being reported in the neighborhood of \$7. Red kidneys are holding their own at \$10.25 to \$10.75. White kidneys are dragging and \$9.50 reports about the highest values, common stock selling as low as \$8.75. Marrows are selling over a wide range due to variation in quality bringing anywhere from \$9 to \$10.25.

CABBAGE IS EASIER

During the heavy storm period, the cabbage market took an upward turn but since then it has become a little easier. Quotations have been in the neighborhood of \$18 a ton F. O. B. but cabbage has got to be extremely fine to bring that price, most business being done at \$14 to \$16.

HAY RECEIPTS HEAVY

Receipts have been fairly liberal in the case in such circumstances, the tone has hay market of late and as is always the turned somewhat easier and values have slumped off about \$1 a ton, \$27 now marking the top for No. 1 hay in large bales. other grades shading down to \$21 for No. 3. Light clover mixed is worth anywhere from \$18 to \$25, depending on quality. Alfalfa holds the same price right along, second cutting bringing \$30 or \$31 for No. 1, \$25 to \$26 for No. 2 and \$23 for No. 3.

GRAIN AND FEED MARKET

The wheat situation may still be generally summarized as weak, although there is some indications of strength developing in the face of unfavorable reports from the southwest.

On February 17, the "futures" closed at \$1.84½ on May wheat. A year ago the market closed at \$1.10¾ on May

wheat. Corn future closed at \$1.28 while a year ago it was quoted at 80¾c.

Cash Grain Prices

Cash grain prices quoted F. O. B. New York City are as follows: WHEAT, No. 2 hard winter \$1.98; No. 2 red, \$2.02½; No. 2 mixed durum, \$2.00½. CORN, No. 2 yellow \$1.40½. OATS, fancy white clipped 66 to 67c; ordinary white clipped 63c to 65c; all elevator, RYE, \$1.66¾ F. O. B., New York.

Buffalo Local Feed Market

The local Buffalo feed market is as follows: No. 3 yellow corn \$1.26; ground oats \$42 a ton; spring wheat bran \$28.50; hard wheat bran \$32; standard middlings \$31; soft wheat middlings \$39; flour middlings \$38.50; red dog flour \$43; white hominey \$46; yellow hominey \$45; corn meal \$48; gluten feed \$39.75; gluten meal \$49.75; 35% cotton seed meal \$40; 41% cotton seed meal \$43; 43% cotton seed meal \$45; 34% oil process oil meal \$44.60.

MEATS AND LIVE STOCK

The market is steady on live calves. Prime veals are bringing \$15.50 per hundred with fair to good stuff bringing anywhere from \$13 to \$15, common veals are worth \$10 or \$11.

Prime live lambs are meeting a fair market. Receipts are not too heavy to cause depression. Prime marks are bringing \$18.50 with fair to good bringing from \$16 to \$18.25. Common lambs are worth anywhere from \$14 to \$15.50.

Live hogs are meeting a steady market, marks weighing in the neighborhood of 200 pounds bringing from 10½ to 11½c a pound.

Help Now Or Fight Later

Continued from Page 207 (3)

All of you remember what happened during our participation in the war. What a fine enthusiasm prevailed. How ecstatic and exhilarated we became. How we responded to every call and demand, "went over the top", in every drive, forgot our differences and our customary intolerances—how we fraternized in this great service to preserve the endangered civilization. For, it was only when we feared its destruction that we really realized what it really meant.

Our entrance into the war ended it. We had the balance of power and used it.

Petty Quarreling

We were suddenly converted from a debtor to a creditor nation, and, incidentally, without any effort on our part, into a world power. The old world powers were all in dire distress. They gave a grateful welcome to their rescuer who dispersed the clouds of defeat that were hovering over them.

Victory was assured. Then came the promulgation of President Wilson's Fourteen Points which covered such basic principles as open covenants of peace, openly arrived at, freedom of the seas, removal of all economic barriers, and establishment of all equal trade conditions, reduction of national armaments to the lowest point consistent with domestic safety, and absolutely impartial judgement of all colonial claims.

Later came the Armistice followed by Peace negotiations. In Paris, instead of men who were freely utilizing their individual attainments for the general good, there was a battle of conflicting interests, petty rivalries and schemes for national aggrandizement. Each group of all the world's ablest and craftiest statesmen and politicians was seeking advantages for its own political entity and resorting to every old, and many new, methods to gain its ends.

The representatives of the various countries had come expecting to find an international court of justice, where a set of supermen would rearrange the earth, settle all disputes, terminate all grievances, and make a new world-map along fair ethnological and national lines.

Yet nobody knew how this was to be done. The little nations looked to the big, but the big were too much concerned with their own affairs, and with the division of the spoils, to be able to suddenly convert themselves into impartial judges. Loyalty to their own countries overshadowed their interest in the general good.

No One For the Common Good

There was just so much benefit to be divided, and in the struggle of everyone to secure a larger share for himself, many failed to get anything, and almost nothing was left for the common good.

The assertion often made that it requires all our capacity to attend to our own affairs is wrong. We have long ago stopped to apply that principle in our own affairs.

The increase of our social betterment efforts of our federal, state, and municipal governments is even greater, though perhaps not so apparent, as our tremendous commercial, economic, and artistic development in recent years. We have had enough ability vigorously to advance our material prosperity and at the same time greatly increase our culture and to raise our standard of living to an unprecedented height.

During this growth, we have developed thousands and thousands of outstanding, capable, broad-minded, vigorous Americans, and we can readily spare a few hundred of these men for

those countries who are clamoring for assistance.

Pilots, guides, and reorganizers—not overlords or exploiters, or bosses—are wanted.

More men like Dawes, Young, Gilbert, Jeremiah Smith, Norman Davis and Howland are in demand. They don't want any of our boys as soldiers. They have more than enough man power for that purpose.

It requires a visit to Geneva to thoroughly comprehend what a splendid start towards a better international understanding has been made by the League of Nations. How thrilling it is to see the representatives of fifty-five countries meeting there day after day, and either in assembly or in separate committees take up the many questions that are submitted to the League and endeavor to convert the genius for war into a genius for peace.

Nearly all were scheming to weaken the arch-enemy, Germany, by despoiling her of territory and creating strong safeguards around her.

The best comparison is that of a legal contest over the terms of a will disposing of a large estate. All the possible heirs were here in Paris:—the legitimate, the illegitimate, and such posthumous children as Czecho-Slovakia and Poland were crowding into court.

Five trustees had, indeed, been appointed to effect a just division—the representatives of Great Britain, France, Italy, Japan and the United States—but these, with the exception of America, were themselves claimants, and the pleas were so conflicting that no human genius, or group of them, could have rendered a decision to the satisfaction of all.

League of Nations Not Complete

President Wilson realized this, and partly because of it, proposed a League of Nations as a permanent body to settle what could not be settled at the Peace Conference.

The League of Nations was formed, but unfortunately the United States failed to ratify the treaty and to join the League.

We were not to participate in this great forward step, and now instead of there being in this world a family of strong nations that are endeavoring to live peaceably together, we are again confronted with the same struggle, the same old disputes, the old contentiousness and a determined effort to establish a new balance of power.

Everybody Is Dissatisfied

It is impossible in the short time allotted me to give a detailed account of how nearly all the countries in Europe are now deeper in the mire than they were before or during the war.

In every one of the countries, there are dividing factions, each of which has a definite plan of action for their government. They are all more suspicious than ever of one another, and nearly all of them are dissatisfied with the terms of the peace treaty.

It reminds one of a fleet of ships that has won a great victory, entered a safe harbor, had a great festival of rejoicing, and when they left the harbor and sailed for their various homes, found themselves in the midst of a great storm, floundering about, buffeting the waves and the wind, fearful of colliding with one another, devoid of any general plan, hoping for the storm to cease and some pilots to come to direct them to safe ports.

The United States must help. This country must furnish the pilots, for it has escaped the storm and has had its ships safely anchored in its harbors.

It is most gratifying that the United States is regarded by all as the only disinterested, unselfish, non-imperialistic

power in the world, who is not suspected of ulterior motives, and who could furnish reorganizers to straighten out the financial and economic difficulties in some of these countries and pilots who could guide them through their seas of trouble.

One can observe outside the official meetings, the splendid fraternizing of these representatives, the give and take policy that prevails, and the unstinted devotion that is given to this great experiment to peaceably solve the many international problems that are submitted to them.

The World's Court has been organized on the right lines, and is demonstrating its usefulness when differences and disputes arise.

But, no matter how important these two institutions are, they have not reached the source of the difficulties. They are right as far as they go, but they do not go far enough.

The League of Nations is restricted by its Covenant. Most of its actions require unanimous approval, and members have the right to retire therefrom on two years notice.

Fortunately, there is now an inclination in the United States to join the World's Court, and in various ways to help as an outsider in the operations of the League.

But, what is really required for the future peace of the world and the immediate better relations of nations towards each other is to organize a body that will ascertain the source of war and its causes, and how to bring the nations of the world into closer relations and under a real working agreement.

It has taken thousands of years and an inconceivable amount of profound study and constant application of a long array of learned judges, lawyers, and legislatures to bring the laws governing the relations of individuals and corporations to its present satisfactory condition.

Each time great advance steps were taken or secured such as the Institutes of Justinian, the securing of the Magna Charta, or the Code of Napoleon, it required prolonged sessions of the ablest leading luminaries of the day, or as in the case of the Magna Charta, domestic revolution.

Therefore, it could hardly be expected that a perfect or near-perfect system of international law could be produced at the gathering in Paris, where practically none of the leading representatives of the various great powers had a majority of their parliaments behind them, and where the Peace Commissioners were expected to pay more attention to punishing the aggressor and to secure compensation for the injuries done them, than to calmly and wisely deliberate with one another as to how to avoid future wars and how to have justice displace force in the relation between nations.

Now is the time to cure that malignant cancerous international growth—War.

THE UNITED STATES MUST HELP TO DO IT.

SHE MUST—irrespective of politics or partisanship, utilize her intelligence and her soul to organize a movement that will dispassionately and intelligently study the requirements of the world and formulate an understanding to which all nations can and will eventually subscribe.

Just as we, in our American states, have, at certain given periods, constitutional conventions to whose deliberations the ablest and most trusted citizens have given their time, so should there be organized an international convention of the ablest people of all profes-

New Jersey Farm News

D. T. HENDRICKSON

AT the recent annual session of the State Grange, Senator D. H. Agans of Hunterdon county was re-elected Master. Practically all the other officers were retained in office for another year.

Monmouth County Pomona, which is one of the largest in the state, has chosen the following officials for the ensuing year: H. P. Conover, Master; Mrs. G. W. Conover, lecturer, and D. H. Jones, secretary. The leaders in the Grange are giving their backing to the legislative program of the New Jersey Federation of County Boards of Agriculture.

Measures for Legislation

Among the measures that have been prepared is a bill to permit farmers to organize themselves into mutual insurance companies to write automobile liability insurance. Another bill provides for a state indemnity for damage done by deer. A vital measure is an amendment to the present law providing for the bonding and licensing of milk dealers. This is to the effect that the failure of a dealer to apply for a license is prima facie evidence of intent to defraud. A bill is also being prepared in reference to daylight saving. Control of weeds along the highways through compulsory cutting just prior to the maturity of the seeds is being considered. Sale of farm products by weight along the lines of the law passed last winter and which went into effect last July, is heartily approved by the farmers. However, the Legislature has been asked to define the term, "standard containers", as it appears in the law. There will probably be a revision of the trespass laws to protect land owners more effectively against infringement upon their property rights.

Monmouth Farmers Exchange Reports

The seventeenth annual statement of the Monmouth County Farmers Exchange shows a net profit of \$21,476.95 for 1924 and an eight percent dividend will be paid April 1st. The exchange now has assets of \$277,444.61. The chief business of the exchange is the co-operative marketing of the potato crop. In Monmouth as in the other potato producing counties of the state, there have come more certified potato seed for planting in 1925 than ever before. The three most outstanding reasons for this fact are the results secured the past three years in the seed source variety demonstrations, publicity on the part of the seed growers intended to show the farmers the advantage, and the comparison where many farmers have tested side-by-side certified with non-certified seed. The Central New Jersey potato crop of 1925 will be distributed to the great Eastern markets under far more favorable conditions than heretofore, if present plans bring expected results. A uniform grade will be established, based on size and quality. There will also probably be a system of inspection at every loading station, using Federal standards.

* * *

Governor Silzer is urging upon the Legislature the creation of county shade tree commissions for the regulation, planting, care and control of trees and shrubbery upon the public highways in the counties of the state. State Education Commissioner John Enright, the son of a Monmouth county farmer, has informed the state board of education that the public school system, including normal schools, cost \$68,175,974.88 in 1923-1924, an increase of \$7,042,976.79 over the preceding school year. Notable advances in administration of the schools are chronicled as requiring teachers, in addition to high school edu-

cation, to attend six sessions of the summer schools. Distribution of the \$100,000 reserve railroad fund to needy rural school districts is also recounted as a step forward.—D. T. Hendrickson.

Essex County, N. J., Building Up Fine Herd at Hospital Farm

One of the progressive institutional herds in the East is the Holstein herd at the Essex County Hospital at Cedar Grove, N. J. The work of building a creditable herd was started only a few years ago and already it boasts of a 1,000 pound individual. Chesney Freda Lothian with a record of 1,296 pounds butter and 26,478 pounds milk at six years of age is one of the recent additions to the ranks of the 1,000 pound producers. She entered the Essex County herd as a junior three-year old from the herd of T. D. Morley, West

Mentor, Ohio. At that time she had a three-year old record of 834 pounds. Freda has started a second yearly test that bids fair to be another 1,000 pound record.

The head of the Essex County Hospital board is King Sweet, who traces to King Fayne Segis and Sir Ormsby Johanna De Kol as his grandsires. King Sweet has five A. R. daughters with records exceeding 640 pounds butter at two and one-half years of age. His offspring not only show strong evidences of production, but they combine type with it as well. They give promise of being heard from in the show ring as they show a remarkable degree of uniformity and a development in the hind quarter that is particularly pleasing to the eye. His daughters possess the kind of an udder that attracts attention because of splendid attachment and shape.

The entire milk production of the herd is used for the 2,200 patients at the hospital. Approximately eighty head

are milking at the present time, and twenty-five of these are on official test.

Maine To Have Building At Eastern States

WITH great rejoicing it was announced at the Massachusetts meeting last week that the funds necessary to immediately erect a \$40,000. State of Maine building upon the Eastern State Agricultural and Industrial Grounds at Springfield has now all been appropriated and pledged.

The state had already appropriated \$20,000 contingent to there being an equal amount subscribed by individuals. The subscriptions have already overrun, and ground will be broken for this building at once so that it may be completed in time for next September's exposition.—David Stone Kelsey.

BABY

CHICKS

Hall's Chickens
From Blood-Tested Breeding Flocks

Business-bred chicks from a big, successful poultry farm—with all the vigor and productiveness that hardy breeding flocks, favorable farm conditions and exacting care can put into them.

Every chick from layers *scientifically tested* and pronounced *free from white diarrhea* by State officials.

Hall's husky, disease-free chicks and weaned pullets from generations of high-power producers are best to own but not expensive to buy. Get the facts before you place your chick order. White Leghorns, R. I. Reds, Barred Rocks, White Wyandottes.

Write today for big illustrated folder which contains information of value to every poultryman.

Some Points I Watch During Late Winter

(Continued from page 216)

and my hens lay on an average a little over 180 eggs a year.

Oats are the only grain we have for them, but they seem to do quite well on them. Only once or twice in my three years of poultry keeping have I managed to buy a sack of wheat or a sack of cracked corn to mix with the oats. It was a great treat to the hens, but when it was over, they continued to do their usual steady work just the same.

The first winter I kept hens I never once gave them grit. I imagined that oyster-shell supplied both lime and grit. It is no great wonder that they did not do very well in the laying line that winter. They require grit just as much as food and water. I save all broken china or crockery ware during the summer and it is ready to be broken up for them in the winter. My birds are Single Comb White Leghorns, and I am thoroughly satisfied with the breed. It is healthy and hardy and hard-working.—HELEN MACFADGEN.

Trapping a Hen House Marauder in Late Winter

A FARM boy in Green County, New York, one of the best trapping states in the East, writes me for advice on how to outwit the wily fox and secure his pelt.

Among other things he says:

"I would like to know if there is any way to catch a fox in a steel-trap with dead bait, such as the carcass of a horse or cow. I have been very unsuccessful so far (Jan 3rd.) as they will come within a few feet of the carcass and trap, and then go away. Some local trappers have told me to smoke my traps with hemlock bows, and some say bury the traps in the ground. I have done this and handled the traps with gloves, but still no results".

I should say that the carcass of a horse or a cow will attract foxes, especially in January and February, better than in early winter, because food is scarcer in the latter months of the winter, and foxes in thickly settled sections of the country where there are not many rabbits or quails for them to catch, and where poultry houses are securely fastened up at night, must get very hungry. In such localities foxes are doubtless in a half starved condition especially during periods when the ground is covered deep in snow, sleet and crusted ice. They probably do not get a square meal once a week in some sections, and subsist on berries, frozen apples, turnips and other root crops, etc., so that while the fox likes to kill its own game earlier in the season, in late winter they surely visit the carcasses of such domestic animals and eat the frozen meat.

Set Several Traps

Around such a carcass you should have a number of traps set in the most likely places, and not depend on just one or two. If you see many fox signs around such a place I should say it would be wise to set at least a half dozen traps around the carcass, some close by it and others 10, 15 or 20 feet away, and especially where you see the suggestion of a trail running toward the carcass from some nearby thicket or brushy point.

Each trap should, I think, be set on a slightly elevated part of the ground,

unless it be in the dim trails which I have spoken of. A fox, and especially if it is his first visit to such a carcass, likes to stand upon a slightly elevated place and size up the surroundings before approaching the carcass. If much snow is on the ground pile up a little flat-topped mound of snow only five, six or seven inches above the surrounding ground, and set a trap on each of one of these mounds. Use an unplanned board for this purpose, not a metallic tool, such as a shovel. Cover the traps with powdery snow. In trails the spot where the trap is should be perfectly level with the surroundings, and look exactly like the surrounding ground or snow. Smoke your traps, and wear clean gloves in making your sets. Also I believe it would be advisable to wrap clean white rags around your shoes when making these sets.

Avoid Human Tracks

Visit your traps every morning, on horseback, not on foot. Ride casually by the place, as if just passing by, and if the locality where each trap is looks just like you left it you can take it for granted that the traps are still in working order, unless a hard crust of ice has formed over the snow. Do not dismount unless this is absolutely necessary. Especially if there is some brushy country near—thickets, fallen tree tops and the like—there may be foxes somewhere near, lying on the lee side of a log or rock, watching you, and if you "monkey" around the place too much on foot you may make them suspicious of the whole surroundings and drive them away.

I do not think it would be necessary actually to bait your traps with any of this frozen meat, but simply set a goodly number of them in the most likely places around the carcass, and especially on the side closest to brush or thickets—the direction from which a fox would be most likely to approach it.

Foxes Are Sly

In riding by such places on horseback I would not stop my horse to examine any of the trap-sets, even from the horse's back, where they look to be all right, for foxes sometimes lie in the neighborhood of such carcasses for days and even weeks, where brushy country is near and other food is very scarce in late winter.

You might also catch a raccoon, skunk, opossum or mink in some of these traps, if there are such animals in your locality.—I. H. Motes.

Sunlight for Early Chicks

NO difference how well we keep the chicks from cold if they are shut away from the sun and open air when hatched very early in the spring we are pretty sure to have trouble with them. This has been my experience where bad weather has compelled me to keep flocks inside for three weeks or more, even though I had them where the sun through the glass could warm them. Sun through glass is not the same as sun direct, and no amount of fresh air can equal the open air for healthfulness. If the brooder is made so they can enter at will and get warm they may be permitted to run outdoors in quite severe weather and they will come back when getting cold.—**RACHEL RAE.**

Good hatches are obtained only when the laying stock has been selected for vigor and made to exercise.

HILLPOT Quality

STURDY PURE BRED CHICKS

HIGH-EGG-YIELD

Always as Promised

We do not promise that you will be getting eggs in less than five months from your Hillpot Quality Chicks—yet customers have given us records where our chicks have beaten that.

Brooding Chicks in Large Numbers

I HAVE done custom hatching for a number of years and year after year see some of my neighbors meet with heavy loss because they have not got a suitable means of brooding their baby chicks. Perhaps the experience of some who have made a success of brooding young chicks would be of interest to the AMERICAN AGRICULTURIST readers. Where only a few chicks are to be reared, a setting hen who will stay on the job to the finish and is without a doubt the best method of incubating and brooding small chickens. When large numbers are reared the modern incubator must be the means of hatching. Whether it is best to buy an incubator, purchase baby chicks or have the hatching done, must be decided by your own convenience, preference or circumstances.

It must be remembered that a bird's temperature runs from 104 to 110 degrees and then they are hatched at a temperature of 103 degrees and if the chicks are once chilled the loss is very likely to be heavy. My own experience has been that a large percentage of setting hens will not own incubator chicks and that often the chicks won't own the hens. Therefore as many hundreds of chickens have been lost from this cause alone, a way that many have tried with success should meet with the approval of the busy farmer and his wife.

Coal Burning Brooder Most Practical

From my own experience and that of many of my customers, we have found the self-regulating coal burning brooders have given the best results by far. A coal burning brooder installed in an 8 feet x 12 feet brooder house will brood 300 chickens. A building of this sort will also be a refuge from hawks and rats, one of the worst enemies of chickens.

Another consideration is the attendant's comfort during stormy weather. While inside a brooder house one can be as warm and comfortable as in their own kitchen.—Arthur Kenyon, New York.

Help Now or Fight Later

Continued from page 222

ions and callings, irrespective of sex, race, religion, or nativity, men who have in their careers shown the wide scope of their sympathies, their broad tolerance of international relations, their knowledge of the science of government, and are possessed of fine logical, analytical, and judicial minds who would deem it the greatest attainable honor in life to be selected as a member of this body.

These men would not be advocates for a given cause, or mouth-pieces for the Prime Minister or Cabinet of their countries. They would be free of directions and orders from home. They would be great minds representing the combined wisdom and knowledge of the world, working undisturbed by the petty ambitions of men, factions, or countries.

Their separate and joint responsibility to labor for the improvement of all the peoples of the world, would spur them on to loftier, higher, and broader aims for the general good.

The result would be a scientific, honest solution of the proper relation of nations towards each other and towards their own citizens, a mutual cooperation of all for the good of all—and the eventual enthronement of justice in place of force.

If I were a clairvoyant, I would see and describe to you this new gathering, this great gathering for the common good. I would see statesmen at work, who would remind you of when the Beethovens, Handels, Bachs, and Mozarts of the past, were working on their symphonies and oratorios. While these men were faithfully cooperating, they would be constantly influenced by Moses' Decalogue, Christ's Sermon on the Mount, Woodrow Wilson's memorable Fourteen Points, and the cries of the people for light and leadership, and how they finally succeeded in creating a grand paeon whose leading motif was universal love and peace. If we stretched our imagination a little further, we could picture the American people with their souls and minds properly attuned for the occasion, listening at their radios to the broadcasting of this wonderful result, and at the end, each one bowing solemnly and saying "Amen".

TWIN HATCHERY,
McAlisterville, Pa.

The Trouble Maker—By E. R. Eastman

THERE was a pause in the work, while several women, with needles in the air, looked at her.

"They say he got shot."

Every woman in the room looked at her with startled eyes.

"Yes, sir," she went on. "They tell me that he went up to old Johnny Ball's, spilled all the milk, dumped a lot of kerosene in the milk house, and then just as he was leaving, old Johnny and the hired man, Bill Mead, caught him."

"Don't believe a word of it," snapped old lady Simmons. "Jim Taylor couldn't do a thing like that."

"Maybe he couldn't but he did," snapped Caroline emphatically. "I got it direct from my cousin, Julia Stanton, and she got it from her husband, and Bill Mead told him, so there. And you forget," she added, "that Jim Taylor lead that band of ruffins who dumped Johnny's milk over in the hollow."

"Yes, Caroline, I did forget," said Mrs. Simmons, but instead of looking at Caroline, she looked directly at Mrs. Greene.

"Still you haven't explained how Taylor got shot," said Ann Jenkins.

Caroline stammered and hesitated.

"Well," she said, "I ain't heard exactly how that was done, but of course he got it some way while he was fooling with Johnny's milk."

"Sounds kind of fishy to me," said Mrs. Jenkins. "But let's change this subject. I'm tired and sick of this milk strike business."

"So am I," said Mrs. Wood. "I wish you all could see the dress I sent away and got from a mail order house. Just as good a fit, too, as they could give me right down in Speedtown. My husband didn't like it though," she added. "Says it's too gay for me."

"Men are funny," sighed young Mrs. Reilly. "My man never notices what I wear. Seems sometimes as though I'd rather he would find fault than never notice at all."

"Speaking of strange critters," said Mrs. Wood, "that's what my man says we women are!"

"Huh! Catch any man saying anything like that to me!" stated Ann Jenkins. "He wouldn't say it but once. He'd get the surprise of his life. If we women are any foolisher than these fool men! Now even the minister—"

Just then the parson put a red head around the door to the basement where he had been kept busy by the women who were preparing the supper.

"What say, Mrs. Jenkins? What say? Did you speak to me?"

"No," she snapped. "Didn't say anything."

"Oh, I beg pardon," he said. "I thought I heard you say something about the minister. Mrs. Jackson sent me up to find out how long it would be until you got the quilt done and were ready for supper."

"It'll take another hour at least," said Ann.

The minister thanked her, and went back downstairs.

"Just like a man," said Mrs. Jenkins. "Always butting in where they ain't wanted."

"Going to the trial next week?" asked Caroline of the room in general.

"Jim Taylor's trial?" quickly asked Mrs. Greene.

"Yes. They say that Judge Rising has set Taylor's trial for dumping Johnny Ball's milk on the calendar so that they will get to it about the latter end of next week."

"Fine chance young Taylor will have with that old sneak," said Mrs. Jenkins.

"That's right," agreed old lady Simmons. "Not much justice in his court."

"Just another example of men's works," said Ann. "How long would a man like

that old politician last if we women could vote?"

"Oh, I don't know," broke in Mrs. Wood. "We women have got about enough trouble now without mixing up into men's business."

"Stuff and nonsense!" boomed Mrs. Jenkins. "I'm s'prized at you! If we mixed up in men's affairs a little more, there wouldn't be so much trouble."

"It's accordin' to how you mix it," laughed Mrs. Simmons. "Womenfolks are at the bottom of a sight of men's troubles, too."

"Ann is right just the same," said Caroline. "If we women could vote we'd get rid of these politicians and then we'd vote out the cursed drink, and after that was done, we'd fix all this nasty smoking and chewing tobacco."

"If women had any spunk," stated Mrs. Jenkins, "they wouldn't have to vote to do that. My man used to smoke, but he wouldn't any more think of doing it now than he would of sassing me back about

"What's the matter, Julia? Anybody sick?" inquired Mrs. Jenkins.

"Dr. Westman is out on a call somewhere," replied his wife somewhat unsteadily, "and Jim Taylor is trying to locate him. Wanted to know if I knew where he was."

"Somebody sick up there?" asked Caroline.

"No," said Mrs. Westman in a low voice, "Jim's mother has just died."

CHAPTER XXIII

Neighbors and friends were come to do honor to the memory of Jim Taylor's mother, come in such numbers that they filled the kitchen, sitting room and parlor to overflowing, and extended well on into the front yard. Some of them were awkward and ill at ease in their Sunday best, and few of them were able to put into words what they felt of sorrow and sympathy for Jim and his sister. But the most of those who crowded the old

What Happened in the Story Last Week

JIM TAYLOR has been informed anonymously by telephone that a few of the more impatient dairymen are planning drastic measures to force John Ball to stop shipping milk. Jim immediately hastened to the Ball farm to try to avoid violence. On the way he is shot from ambush by Shepherd, the local representative of the milk dealers. In spite of his injuries he overcomes his assailant and compels Shepherd to take him to John Ball's in his car (Shepherd's). They arrive in time to see several dark figures running away from John Ball's milk house. Jim runs up to see what has been done. After peering into the milk house he turns about to find himself facing a shotgun in the hands of Johnny Ball. Hearing the commotion, Dorothy comes down to investigate and she herself asks Jim if he was responsible. He refuses to answer. Weakness overcomes him from his wounds in the former encounter and he goes home, leaving with a promise that he will not run away. The next day the Ladies Aid holds its meeting in North Speedtown and the entire discussion centers around the milk strike with much speculation as to just how Jim got his wound.

something else when I lay down the law to him."

This statement seemed to daze the women for a moment, until young Mrs. Greene spoke up and said:

"Well, I for one never would vote for Judge Rising if I were a voter, because he isn't a bit good looking."

The doctor's wife looked up from her work.

"Are we so much different from the men?" she asked. "After all, we're human just the way they are. I think women should have the right to vote if they want to, but after all, I don't know whether the world would be very much different if we could. I think that even now we have considerable chance to influence our husbands' opinion."

"I think Mrs. Westman is right," said old lady Simmons. "Men folks aren't so different than us as they run. It makes me think of a story I saw a while ago in the AMERICAN AGRICULTURIST. A politician said to his friend: 'There is certainly no use talking. The women have much better morals than the men,' and the friend inquired, 'What makes you think so?'. The politician said, 'You can give a man three dollars for his vote and even then you never can be sure how he will vote, but you can give three dollars to a woman and she will vote the way she agreed to every time!'"

Just then the minister's small son appeared in the door of the room. He was out of breath.

"Is—is—Mrs.—Westman here?" he asked.

"Yes," said the doctor's wife, getting up.

"You're wanted—on the telephone—at our house."

While Mrs. Westman was gone, conversation lagged, as the women completed the tying of the quilt. After a few minutes the doctor's wife appeared in the door. Her face was white.

Taylor farmhouse were there to show their love and respect and sympathy, more sincere perhaps than some who could express themselves more easily.

Horses, were tied to trees and to the road fence. A few automobiles were mixed with the wagons. Near the yard gate stood that most ominous and saddest of vehicles.

Conversation among the men who stood about in the yard lagged or was carried on in undertones.

"Too bad," said Wood, "that this come upon Jim right now. It's hard on him, and besides we farmers need him to keep things goin'. This milk strike's gettin' kind of shaky."

"Some one," spoke up Jackson, "said that the old lady had been worried pretty much over the whole strike business, and especially about Jim's coming trial. Probably helped to bring on the end."

"Yes," said farmer Wood, "Jim's got his arm in a sling you know, and it's bein' talked around that Johnny Ball shot at him for putting oil in his milk. Probably Jim's mother heard that too, and it added to her worries."

"Well, the old soul is out of her troubles anyway. She had a hard life," added another philosophically.

"It's mighty tough on the boy and his sister," said Jackson.

Just then a small car stopped near the gate, and a girl in dark clothes climbed out, and waited a moment for an old man with a white beard to get out of the car and join her. Then side by side, they marched up through the silent gaping crowd. The old man looked neither to the right nor to the left, until they came to the kitchen door and disappeared within the house.

"Well, I'll be jiggered!" exclaimed Ralph Royce; and judging from the looks of the other men, they were all "jiggered".

"That's just like old Johnny," continued Royce. "Got to admire the old boy. In spite of the feeling against him, he does what he thinks is right, and comes to

show his respect to an old neighbor who has passed on."

Several nodding heads showed agreement with his statement.

Inside the house there was a rattle of chairs as Fred Winter, the undertaker, bustled about to seat the people. The sibilant sound of whispering added an unnaturalness as some of the women visited behind their hands.

Among those was Caroline Hicks. Caroline was in her glory. For more than a dozen years, she had not missed a funeral in the neighborhood, and for weeks afterward, she would relate to anyone who would listen all the gruesome details.

She leaned forward now to whisper in the ear of Ann Jenkins seated in front of her.

"Don't you think she looks natural, Ann?"

Mrs. Jenkins grunted, but made no audible reply. So Caroline gave her attention to little Mrs. Wood sitting next to her.

"I declare, Harriet, if poor Miz Taylor don't look better than she did before she died!"

"Sssh!" said Mrs. Wood. "Somebody'll hear you!"

Caroline was not so easily stopped.

"They say that this milk strike business and all of Jim's carrying on killed the poor old woman."

"For heaven sakes," grated Mrs. Jenkins, turning around in her seat, "I'm s'prized at you, Caroline! Can't you keep still in a place like this?"

Caroline subsided, but only for a few moments.

"They say that Jim paid fifty dollars for that coffin! He's poor, too. Such extravagance! Why that's more than old Miz Japhet said for Tom Japhet's coffin, and they say as how the Japhes have got a right smart bit of money."

"Caroline Hicks, will you shut up?" growled Mrs. Jenkins, while all the women in that vicinity were looking uncomfortable.

Caroline sniffed indignantly, tossing her head.

"Things have come to a pretty pass," she snapped, while the color showed in her cheeks, "when a body can't talk about the dear departed."

But this remark fell squarely on the broad, uncompromising back of Mrs. Jenkins, and for a time Caroline was still.

There was a stir outside of the door, and the women craned their necks to see newcomers. As they looked, John Ball and Dorothy appeared in the doorway, turned to the left, and passed by the gaping women into the room beyond. Caroline's mouth was wide open.

"I declare to goodness," she said loud enough for all the women around her to hear, "I'd think poor old Miz Taylor would turn over in her coffin!"

Mrs. Wood, with cheeks aflame, suddenly got up and moved down to a vacant chair in the opposite end of the room from Caroline. Two or three women looked as if they wanted to do likewise.

But Caroline could not be stopped.

But Caroline could not be stopped.

"Of all the nerve," she continued sanctimoniously, "of that girl's marching in this place like that, after all she's done!"

This was the last straw for Ann Jenkins' naturally short temper. She snapped her big body quickly around in her chair, faced Caroline, and said to her so that those who were near could hear:

"Caroline Hicks, what do you come to places like this all the time for? To show your respect, or to clatter all the time?"

Caroline dabbed at her eyes with her handkerchief, and said:

"Ann Jenkins, don't you dare talk to me that way! Would you take away the only joy a poor woman has in trying to

(Continued on Opposite Page)

show her respect for the dear departed?"

Ann faced to the front, again, and a silence fell upon the room.

In the parlor were gathered the near friends and the relatives, a few cousins, an aunt, a white-faced, red-eyed drooping daughter, and Jim, the son. In his eyes there were no signs of tears, but those who sat with him could trace the lines of pain in the long, lean face, and knew the effort for control he was making by the set jaw and the clinched fingers of the uninjured hand.

At last the people were seated, the undertaker had completed his arrangements, and the hour had arrived. The minister arose and began to speak.

As his words, spoken in a simple, conversational tone, spread through the house and to the outside yard where the men stood with bowed heads, a hush spread over his audience. There are many preachers who deal in fine words, but who do not seem to have the sympathy and understanding to make those words winged messengers of communications to the souls of men. But there are also a few of them—who are able to make their message reach into the broken hearts to bring comfort in and resignation to the the immutable laws of Nature and of Nature's God.

Jim listened, and as he listened, the suffocating feeling of tension in his throat relaxed. The minister was not speaking of the dead, but to and for the living.

"That which is past is irrevocable," he said. "That which is to come may be faced with greater courage if we but know how and so will it. The span of human life is infinitesimal compared with eternity, and we who found all of our hopes on temporal things are sure to reap our reward in sorrow and disappointment. Our little goings and comings which seem so important to us are of no account in the scheme of things unless they are in ac-

cord with Nature's laws, with God's laws, and are founded upon eternal truth."

The haze of sorrow in Jim's heart seemed to clear a little and he began to think of the comforting words of the minister. After all, maybe such things as milk strikes and temporary disaster are not important. Mother was gone, but maybe not gone far.

Then the minister leafed over his Bible, quoting here and there the passages for those who mourn, pausing frequently to let his hearers think of the beautiful old words.

"For He knoweth our frame; He remembereth that we are dust. As for man, his days are as grass; as a flower of the field, so he flourisheth. * * * But the mercy of the Lord is from everlasting to everlasting"

"Yea, though I walk through the valley of the shadow of death, I will fear no evil; for Thou art with me: Thy rod and Thy staff they comfort me"

"We are troubled on every side, yet not distressed; we are perplexed, but not in despair; persecuted, but not forsaken; cast down, but not destroyed."

The minister closed the Bible, and raised a serene face to his audience.

"When I am tired and the cares of the world weigh heavily upon me," he said, "I like to read these passages, and best of all, I like that promise of Jesus when he said:

"Come unto me, all ye that labor and are heavy laden, and I will give you rest."

"Let us pray."

The minister's voice ceased. The prayer was ended. There was a pause, then a few opening chords on the old parlor organ. Softly, gently, a girl's voice, low-toned, deep-throated and beautiful, picked up the notes:

"Lead kindly light, amid th' encircling gloom,

Lead Thou me on!

The night is dark, and I am far from home;

Lead Thou me on!"

It was Dorothy. As the words and the music of the hymn flowed through the quiet rooms, it seemed to Jim that they were meant especially for him. Certainly to him the night was dark, and he felt the need of light.

Was he dreaming, or was it true that the girl who was singing seemed to be reaching straight across the room, across all the misunderstanding and heart-ache, and the bitterness of months to lay the comforting hand of sympathetic understanding upon his troubled heart?

"Keep Thou my feet; I do not ask to see, The distant scene, one step enough for me."

Oh, if he could only see just one step ahead! Perhaps he could, if he tried. What was it that Dorothy was trying to tell him?

He looked around and met her eyes, as she stood by the organ. It was true—she was singing for him, and him alone!

On her part, she had forgotten that there were such things as milk strikes and quarrels between neighbors. She remembered only the boy that she had known, a boy that was in trouble and needed comforting.

"So long Thy pow'r hath blest me, sure it still

Will lead me on

O'er moor and fen, o'er craig and torrent, till

The night is gone;"

Maybe that was true, thought the boy. It was not Nature's way to mourn. Yes, that was what Dorothy was trying to tell him.

"And with the morn, those angel faces smile,

Which I have loved long since, and lost awhile!"

As Jim listened the awful pain in his heart was eased. He was able to think more clearly. Life could not be all bad. And Dorothy at least sympathized with him—he knew that now—even if she did not love him.

The music of the old hymn and the girl's voice had done what words could not do. The boy and girl were nearer in spirit than they had been before in many long weeks.

Fresh,
Soft,

Water

Under Pressure in YOUR Home at the
"Turn of a Faucet!"

The Hoosier Water Service operates from
any source of supply—from well, creek,
spring, lake or cistern, giving you that most
advantageous convenience of the city—run-
ning water. Think what it means to have
water under pressure for drinking, kitchen,
bath, garden, lawns, garage, stock and for
fire protection! Do away with the drudgery
of pumping and carrying water for no more
than the cost you're now paying. Uses any
power—gasoline, electricity, or wind. Easy
to install and operate. Protected inside and
out by special GALVAZINK process. First
cost is low and it gives long years of unin-
terrupted service. Sold by reliable mer-
chants.

My Ideal Husband

Aunt Janet is Told What Farm Women Like in Men

NEARLY a hundred of them! What? Why, ideal husbands of course! Every day since announcing the contest, I've heard about more of them and the delightful thing about it has been that in nine cases out of ten the writer of the letter assured me that there was such a thing as an ideal husband and that she had married him! I only hope that Editor Eastman finds, as he opens the Ideal Wife letters, that the husbands in their turn are as well satisfied with their other—I won't say better—halves as are the wives.

If only there were room to publish all the letters! It seemed as if each one deserved a prize and yet of course we had to choose the best.

Because they seemed to say the most within the limit of 200 words (and very, very many of our letter writers overlooked that limit of length!) we decided upon the three letters printed on this page as prize winners. We have not signed any names as most of the writers asked to remain anonymous. Perhaps they didn't want their husbands to find out and get conceited!

First Prize (\$2 in cash and a book)—Mrs. E. G., Pa.

1—My husband is true—true to himself—his wife and family and everyone that he comes in contact with.

2—He loves his home, his wife and his children. He is kind to every living

paragon, must be honest, industrious, kind and genial among his associates as well as around the home, fond of children and willing to spend the majority of his evenings with his family.

He would be optimistic and willing to lend a hand to other less fortunate than himself. Neither must he be self-conceited. He would be neat around the house and treat his wife as his equal, making her his confidant in business and financial matters, belong to a good lodge, be moderate in his habits and morally clean. He must be fond of good reading matter and be as generous as his circumstances would permit. Last but not least he would never be too busy to put his arms around his wife and kiss her, thus endeavoring to show his appreciation of her hard work and daily sacrifices.

A man possessing these qualities is sure to be a true Christian, which I would expect him to be.—Mrs. S. R.

Third Prize—(A book) Mrs. C., New York

My Ideal Husband is, first a Christian, living a true and consistent life seven days a week.

With this foundation it follows that he is clean and upright, progressive fair-minded, dependable and good tempered. He is a man of value in his community.

He has a fair business sense and the ability to provide comfortably for wife

he has to keep house alone. He is glad for her to have a little vacation."

Mrs. H. E. R. likes, after the important points of character are covered, a man who is musical in some way, either as a singer or an instrumentalist. Mrs. F. P. requires "one who does not stoop to jealousy—'trust and be trusted' his motto", and she also adds the important point, "one who can agree to disagree, who can talk over matters in a cool, sane way and always in private".

He Just Needs Common Sense

"Just commonplace good sense" is required by Mrs. A. M., who also says: "Last and most important of all, he must be just my husband, and willing, when possible to spend as much time in his home, as he was anxious to spend in my father's home during our courtship, and treat me in the same courteous and agreeable manner".

The husband who doesn't forget to show his love and appreciation is often mentioned. Surely we can all agree with Mrs. C. H., who says she is a life-long reader of the AMERICAN AGRICULTURIST, when she writes "and most of all when his wife gets discouraged he must take her in his arms and cheer her up. My, how a good hug and kiss from daddy will make things much brighter!"

A very interesting letter, somewhat over the word limit, was from a nurse, unmarried herself but a keen observer who has seen a great deal of married life from the inside. She speaks especially of appreciation, sympathy, ambition and the ability to get along with others without friction.

Companionship Essential

Mrs. T. T. speaks of friendship, the ability to get along well together, as well as love. "You know how some good persons get on your nerves", she says, "my ideal husband has a quality for which I can hardly find a man, that invisible bond that links friends together."

"He must keep well informed on important topics of the day," says H. S. and take active interest in community and government affairs. "I want him to be a good companion", says Mrs. I. M., touching on the same point as Mrs. T. T., "to help a sick friend, pet his animals, read with me, laugh with me, enjoy a pretty sunset or a starry sky."

A young girl writes of her ideal and says very sensibly "If it takes two to make a quarrel it also takes two to make a happy home".

Mrs. D. says, rather wistfully—and her opinion is echoed in several other letters—"It would be nice not to have your husband swear, but this is such a general habit, I suppose it would be hopeless to try to locate a man". Another Mrs. D. says "Of course he must be a farmer," which many other readers agree to, but she adds a quality surprisingly missing in many letters—a sense of humor and jolity. Mrs. M. T. also says that a spirit of fun prevents quarrels.

He Must Not Be Stingy

Many seem to be afraid of the man who is too saving, although all approve of reasonable thrift. Mrs. S. says "his wife should be his partner in spending as well as earning the money, and his children would have all the chances, comforts and pleasures that he could honestly afford".

After stating "first and foremost, no stinginess", Mrs. R. H. says "I want him modern to the extent of admiring bobbed hair. I want him to help instill

(Continued on Opposite Page)

thing,—I could not respect a man who was cruel.

3—He is respected in our community; is always ready to respond to civic duty when called upon.

4—He is not a church member, but is true to his God and church obligations.

5—He believes in having a home wherein a stranger may enter and be welcome.

6—He respects my relatives and lives his life clean and upright so that they respect him in return.

7—He never forgets I am his helpmate in all things and considers me always—whether the business applies to the home or elsewhere.

8—He never forgets that I love him and surely have his love in return. His caresses are just as dear and sweet to us both as in the days gone by.

9—He is brave in times of adversity and is always ready to respond to a neighbor's call.

10—I cannot help but love him and after fifteen years of married life I surely ought to know that he is still—My Ideal Husband.—Mrs. E. G.

Second Prize (\$1 in cash and a book) Mrs. S. R., N. Y.

My ideal husband, while not exactly a

and children, which means not only the bread and butter of life but some jam also, with occasional "hyacinths to feed the soul", and he gives his wife regularly a certain amount that is unquestionably her own.

He not only loves his home and children but does his part toward making an ideal home life by being considerate, appreciative and helpful in the little things of daily living, and he shoulders his share of the training and discipline of the children.

I will add (which may seem outside the question, but really is most important) that he is, first, last and always, a good son.

This ideal husband is a real one. His wife says "He does not lose his little belongings and I sometimes wish he were more of a talker."

But who would want him perfect!

Mrs. C.

All Had Interesting Ideas

Many others were short, to the point and fair in their appraisal of what makes a man worth marrying! Although I cannot print all of them, I agree for instance with Mrs. G. C. R. of Pa., who says: "He is willing for his wife to go on a visit once in a while. Even if

Planning the Easter Program

Mrs. Yale Suggests Something Besides Recitations---Spring Fashions

MRS. YALE will be remembered by AMERICAN AGRICULTURIST readers for her helpful article called "Leave It To The Ladies' Aid," published a few months ago. In her suggestions for planning the Easter program, Mrs. Yale shows the same resourcefulness, but this time she tells how to go about it and leaves the actual details "up to you."

EASTER, with its lilies, hyacinths and rosy azaleas will soon be here, and surely it is time to prepare a program fairly alive with happiness, for the joyous day of resurrection! Young

Of course you have noticed how very popular the pageant has become in the last few years, but perhaps you have had the impression that an Easter pageant would mean elaborate costuming and many rehearsals. On the contrary it is quite simple. There need not be expensive costuming, and as a pageant consists of a series of scenes or "episodes" each of these may be placed in charge of a different person, thus simplifying the rehearsal problem. Usually one final rehearsal is sufficient. The beautiful Easter story can be presented

"Speak a piece? I'll say not!" Of course you have received that discouraging reply when you have asked some of the young folks to take part in a general program. But all young people like to "act" and the presentation of a little Easter drama would surely appeal to these scholars of what is admittedly the most difficult age. The boys can be very helpful in the matter of shifting the scenery, and arranging the lighting effects. The secret of holding the youth in Sunday School consists in giving them something to do!

At the Last Minute

You say you didn't mean to put off planning, committee, but somehow you did? Then let me tell you of a special help for you last-minute folks who are broadcasting a desperate S O S. Of course a cantata or play or pageant are out of the question, but if you have postponed your preparation too long, ask the publishers for an Easter Song Story, and your problem is satisfactorily solved. Perhaps you know that a Song Story consists of a vivid Easter narrative which may be read by a good reader. The story is interspersed by appropriate songs and solos, tuneful and easily learned. These are rendered by a choir and as a rule one rehearsal is quite sufficient. So there you are!

It takes time to plan a program? Of course it does, and so does anything that is worthwhile doing, but what happiness your Easter celebration will bring to the folks of your community. After all, there is no greater joy in the world, is there, than bringing gladness to others? So start your program, and begin in time!—Elsie Duncan Yale.

My Ideal Husband

(Continued from Opposite Page)

into the minds of our children that they must get a college education. And at least once a year, I want him to leave behind, chores, crops, stocks, everything but me and take a week's vacation."

"Where is the wife who does not like to be called a girl?" asks Mrs. E. P. "I've often heard men say 'old woman, can't you do better than this? Instead, my ideal would console me with something like, 'cheer up, girlie, there's always sunshine behind the cloud'. My ideal must be kind not only to me but everything he comes near—even the dumb brutes must be glad to have him near."

Marriage Sixty-Sixty

"Marriage is a sixty-sixty proposition" says Mrs. A. N. while one who signs herself "satisfied" says "he is dependable; if he promises a new dress or hat it is forthcoming."

"First and most important, a Christian," says many, and almost all of physical and moral cleanliness, unselfishness, love of home and kindness to children.

And in conclusion, Mrs. C. P. submits a verse on the subject "My Ideal Husband"

"A Christian both in word and deed, With tender heart for sufferer's need, An honest upright, manly man, Whose daily motto is I can.

His only love, his joy, his pride." home,

Nor cares he far from it to roam, Unless she, too is by his side, His only love his joy, his pride."

Aunt Janet

Sprains. Treat a sprain with vinegar and water by bathing the sprained part freely with one part vinegar to three parts of water.—(Mrs.) A. W.

Easier washday! You save wear-and-tear! Clothes come clean quicker!—when you have the extra help of Fels-Naptha Soap!

SPRING FASHIONS CHARM THE EYE

BEFORE we go further: Have you seen our new Spring and Summer catalogue? It has so many pages that it is itself a "stylish stout" and it has patterns for the plump and the slim, the young and the old. Embroidery designs and hats too. Well worth the nominal price—10c. Add it to your pattern order without fail.

No. 2300. No longer need the stout woman resignedly wear frocks of Mother Hubbard lines, for now-a-days fashion authorities consider her problems and design smart clothes for her needs. No. 2300 is a slip on dress becoming to any figure but especially the full one. It cuts in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Pattern, 12c. Size 36 takes 4 1/4 yards of 40-inch material. Hot iron transfer pattern, No. 730 (blue and yellow) is 15c extra.

No. 2383 is a one-piece dress with the modern version of the always popular Peter Pan collar. The young girl or girlish woman will delight in its comfort and becoming lines. No. 2383 cuts in sizes 14 and 16 years, 36, 38 and 40 inches bust measure. Size 36 takes 3 yards of 42 inch material, with 5/8 yard contrasting. Pattern 12c.

No. 2073. The one piece dress looks best over a straight-line, loosely fitted slip and so easy are these slips to make and wear that no one quarrels with the verdict that they are the correct thing. No. 2073 is so arranged that you can use it either for a costume, with—for instance—a black satin skirt to be worn with blouses, or as an under slip for summer dresses. Sizes to please everybody: 14 and 16 years, 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Use 3/4 yards of 36 inch material for the camisole and 2 yards 40 inch for the skirt. Pattern, 12c.

No. 2386—The picture shows how cleverly this apron cuts to save material. It comes in sizes small, medium and large. The medium size requires 1 1/4 yards of 36 inch material. Pattern, 12c.

TO ORDER: Be sure names, addresses, pattern numbers and sizes are clearly written. Enclose correct remittance and send to Pattern Department, AMERICAN AGRICULTURIST, 461 Fourth Ave., New York City, Add 10c for the new Spring Catalogue.

For the Stout Woman

The Slim Figure

Under One-Piece Dress

The Useful Apron

and old must have their part in it, and there must be a glad celebration of the day of days.

Now, committee, we musn't put off planning till the last minute, for we want to have something good, this year. So let's begin early!

First Of All

First, we will choose our material, some of the cheerful new carols that the school will love to sing, and some good numbers for our programs. Publishers of Sunday School material will, as a rule, send gladly and promptly free samples of special musical services, and also books "on selection" to pastor or committee chairman. In some cases it may be necessary to purchase a book or pamphlet whose title sounds as if it were "just what we wanted", and it will be money well spent. And again

remember, begin your planning in time. in such a colorful and reverent manner as to make a lasting impression on those who participate and those who see.

A General Program

You'd rather have a general program? Well, that's always interesting, and here too it is usually the best plan to divide up the responsibility, and let each department furnish its own contribution toward the program, thus stimulating a pleasant rivalry. But do avoid the "long, long trail" of recitations which so frequently comprises a general program. Use exercises and drills found in the Easter entertainment collections, compiled by Sunday School publishers. Of course every one enjoys hearing the tiny folks speak "pieces", but for the older children the exercises are admirable.

Not only soap—but soap and naphtha

Colds Stopped in a day

Hill's stops a cold in 24 hours, and Grippe in 3 days. Your druggist guarantees it.

It combines in the utmost way all the essentials in dealing with a cold—cold-checks, laxatives and tonics.

Millions now employ it. In 25 years no way has been found to improve it.

Don't take chances, don't delay. Insist on getting the best cold treatment men have yet developed. And start now. Every hour gained saves much danger and discomfort.

When The State Can Take Property

I am writing for some advice from you and hope that you can tell us what can be done in this case. Some men are surveyors for a new road. We do not know who is doing it, but heard it was the State—now what we want to know is can they go through any one's property and cut down trees and tell folks that they will have to move buildings without seeing the owners of the land, and say that they will pay just what they want to and cut the land in three corner lots?

This is what seems to be going on here. Some of the farms will be cut into, another will be all three corner lots. Who wants three cornered lots to build on? It will cut our land so about fifteen acres will be dead loss to us and make flatiron shapes out of our farm. They count on going right through all of our second growth that we were taking care of. The State tells us to plant more trees. Why do they want to cut a lot down when they can find places better and will not have to cut any down. About a mile further up the people would be glad because the land is so poor in some parts that it is never used; it just lies there. But through this part every farm is in use now.—L. A., New York.

REPLYING to your recent letter concerning the construction of a road-way through your land, it is our opinion that the State has that right provided it follows the proper legal procedure. Under the power of eminent domain, the State can take private lands for public use.

Such taking, however, must be by condemnation proceedings brought by the State in the proper Court. If such proceedings have not been instituted, you are entitled to prevent any trespass upon your land, even though the trespasser is a State official. When such proceedings are brought, the Court fixes a price the State must pay, and until that price is paid the land remains yours. Our suggestion is that several of the land owners combine and employ a local attorney to protect their interests.

Sales But Not Deliveries

I wish to ask you if the Associated Automobile Owners' Association, 433 Washington Street, Reading, Pa., is among the humbugs. They have sent me a sign to put up but I do not want to put it up unless they are all right. I had intended putting a \$25 advertisement in the Blue Book, but the agent said that subscribing only \$15 to the Associated Automobile Owners' Association sign would bring us more tourists. I will say that I thoroughly enjoyed the tourist business last summer and am preparing to make a business of it this summer.—Mrs. W. E. S., New York.

Upon receiving this inquiry, we wrote to the Reading Chamber of Commerce, Reading, Pa., where the Associated Automobile Owners' Association has its headquarters, and received the following reply from them:

We have had complaints about the lack of service of the A. A. O. A. and some of our letters gave us the thought that it was an organization selling service which was frequently not delivered. For a long time it seemed to be a one man concern and neither the local Automobile Club of over 4,000 members nor our organization are impressed with the value of this association.

This should be about all that is necessary to convince anyone that \$15 or any other amount with this association would be an unwise investment.

Exchanging Wool For Woolen Goods

"IN THE good old days" our grandfathers used to grow the wool which grandmother and her daughters later wove into homespun for the family's use. Then with the beginning of the small manufacturers in this country, grandfather used to take his wool to a small, nearby mill and had it made into clothes for himself and his family or exchanged it for clothes which the manufacturer had in stock.

Occasionally the Service Bureau receives an inquiry from some of our people wanting to know if it is still possible to exchange wool for manufactured woolen goods. In order to get the information to answer an inquiry of this kind we wrote F. E. Robertson, Manager of the New York State Sheep Grow-

ers Co-operative Association, Syracuse, N. Y., and Mr. Robertson replied as follows:

"Except as one finds advertisements in the agricultural papers, I do not know of any mill that makes a business of receiving small clips of wool to be manufactured into a product for the individual. Years ago this custom was quite common, but owing to the limited amount of business that might be obtained in this way, I judge the practice has been largely discontinued.

"Occasionally a small mill advertises that it will receive wool and will return to the shipper a certain quantity of manufactured woolen goods. I do not know that they guarantee that the woolen goods will be made from the wool consigned by the shipper. Anyone familiar with the manufacture of wool would understand that these small consignments cannot be spun and woven into cloth with any degree of economy."

A Sound Investment

Financial Department: Will you kindly advise a subscriber since 1873? I have 22 shares of American Telephone and Telegraph (\$134) I wish to invest in Pennsylvania securities on account of inheritance taxes. I can change into Jones and Laughlin Preferred and get about 27 shares preferred stock (7%) which will give me almost as much income. Do you think it is advisable to own 44 shares of Jones and Laughlin stock (having \$25,000 in sound securities) or is this too much of one kind to hold? I am about 70 years old and am looking to safety first. Could you suggest other securities? What do you think of Pennsylvania Railroad and Baltimore & Ohio Common—J. M. C., Pennsylvania.

Jones & Laughlin preferred is a high grade investment. The only objection to your adding to your holdings would be that it would make too large a proportion of your capital in one stock. Why do you not consider Philadelphia Electric preferred? This is a sound investment and as we understand it tax exempt in Pennsylvania. Pennsylvania Railroad and Baltimore & Ohio common both have investment merit but also carry a certain business risk which we do not feel like advising you to assume.

Enforcing Prohibition

I am an old reader of the American Agriculturist, but have never asked any questions before. Does a man have the right to have several barrels of cider in his cellar and give it to others to drink? It seems a pity when they are stopping the sale of liquor they will allow cider, for it makes many sad homes. What could be done about it? So many different ones will be glad to read the answer.—Mrs. C. A., New York.

Under the recent decision of the Federal Court in Maryland, in which Representative Hill was involved, a man is entitled to make intoxicating beverages in his home for the purpose of giving some to his friends. It cannot be transported from one place to another, however, nor can it be sold. Hence, there is no way to prevent the keeping of barrels of cider in the cellar on one's home.

Where We Were Able To Help

The following are the kind of letters that we naturally like to get and that come in every mail:

"On January 6th we received a money order from the Anchor Specialties Company for the balance due us. We thank you very much for your trouble.

"We have taken the American Agriculturist for five years and consider it one of the best farm papers of the day."—E. C. M., Bradford Co., Pa. Here is another:

"In regard to the trouble with the Eureka Stove Company, I want to thank you for your prompt and helpful service. Last Friday we got the shipping bill, and Saturday the reservoir came. I truly appreciate the trouble you took."—J. W. N., Chautauque, Co., N. Y.

We are human enough to like the appreciation, but better than this we like the feeling that we can be of some real help to farm people.

I Learned this Priceless HARNESS SECRET From a Pail Handle

Made in all Styles
Quickly Adjusted
This Strap was Short-Snubbed

Down after 30 Days' Trial; Balance Easy Monthly Payments

To prove my claim that Wear-More is the strongest harness made, let me send you any style you select for 30 days' free service on your own team. Test it in every way. I take your word for it if not then convinced. Simply return it to my expense. Write today for big, free book, with new reduced prices. See how I've done away with rubbing and see-sawing between leather and metal. Doubled wear right here! Learn how short-snubbing of leather under buckle edge or around narrow metal units costs you money in break-downs and repairs. See how I overcome this—now I learned this priceless harness secret from a pail handle. I believe you owe it to your pocketbook to investigate, at once, this marvelous advance in harness-making and harness value.

Let *World-Flight* dependability help you build farm profits

*A fact which links a familiar farm sight
with this great American aviation achievement*

THE MEN who planned the record-breaking *World-Flight* of the U. S. Army aviators knew the importance of correct lubrication.

With danger lurking in every mile, with new obstacles to be overcome daily, with unexpected conditions developing hourly, the first and foremost requirement was dependability.

Only with correct lubrication could smooth, powerful, *safe* operation be assured.

Every farmer will be interested to know that the Army engineers who selected the oil to meet this supreme test, selected the very oil which today lubricates thousands of farm tractors. They specified Gargoyle Mobiloil "B", the identical oil which so many farmers use daily to assure the most economical operation of their tractors.

During the warm weather months when your tractor must work without interruption, this same Gargoyle Mobiloil "B" gives most economical lubrication to the Avery, the Holt, the Oil Pull and many other makes of trac-

tors, while Mobiloil "BB", which is an oil of exactly the same high quality and character, but a little lighter in body, means profitable operation to the Fordson, the Cletrac, the Wallis and others.

* * *

Airplane engines and tractor engines work constantly under full capacity. They perform heavy-duty, heat-developing service, and the use of unsuitable oil is sure to result in premature breakdowns and wasteful fuel and oil consumption.

To use the grade of Mobiloil recommended for your tractor, your car or your truck, is to secure the same dependability of engine performance that was demanded in the history-making feats of the United States Army Fliers.

Near your farm there is a dealer who will be glad to tell you exactly which grades of Mobiloil are best suited to your work. On his walls, he has the Gargoyle Mobiloil Chart of Recommendations which specifies the correct grade of Mobiloil for every make and model of motor.

Mobiloil

A Good Garden is Half a Living

The highest grade obtainable and that quality only, at the lowest possible prices is our business maxim, not only for 1925, but it has been our maxim for over a third of a century, during which time from small beginnings, Dibble's Farm Seed Business has built up the largest strictly Farm Seed Trade in America. Quality, Fair Dealing, just and reasonable prices have made our

business what it is and we thank our thousands of customers for their liberal, generous and continued support from year to year.

We are Seedgrowers, over a thousand acres in our own Seen Farms, owning warehouses, elevators and seedhouses with a capacity of over

100,000 BUSHELS

located on three private switches connected with two trunk line railroads. We operate our own Seed Testing Laboratory where we test our Farm Seeds and every bag has a tag showing purity and germination.

Dibble's famous money-back-if-you-want-it guarantee subject to any test you choose to make within ten days after the seeds reach you is as fair and square as we know how to make it.

We grow and handle a comprehensive line of Farm Seeds, in fact "everything for the farm," but the following are our leaders.

D. B. Brand Alfalfa, Clover and Timothy Seed, 99.50% pure or better, the Cream of the Crop.

Dibble's Recleaned Timothy-Alsike Natural Mixture, 20% Alsike, less than 1% weed seeds. The Bargain of the Grass Seed Trade at \$5.00 per Bushel.

Dibble's Seed Oats, Heavyweight, the heaviest and most productive American Oat, weighing 42-45 pounds and yielding for our customers from 80 to 117 bushels per acre on a score of farms.

Twentieth Century, Early, 34-38 pound grain and enormously productive at \$1.00 per Bushel in quantities.

Dibble's Seed Barley, Oderbrucker and Canadian Six Rowed. None better.

Dibble's Spring Wheat, Marquis Type, best for the East.

Dibble's Seed Corn, Mammoth Yellow Flint, Improved Leaming, Mammoth White Dent, Drought Proof, Big Red Dent, Early Yellow Dent and White Cap Yellow Dent. Average germination, all lots tested to date, above 90%. Demand tested corn this year of all years.

Dibble's Seed Potatoes. The best 11 varieties, early, intermediate and late, including Dibble's Russet, the best all round potato now in cultivation on American soil, in any quantity, from barrels to car loads. Seed Potatoes are comparatively cheap this year and we are able to quote a number of our best varieties as low as \$2.50 per Barrel Sack, as long as our present stock lasts.

To those who have never used Dibble's Farm Seeds, we say—"Let's get acquainted." Your name and address on a postal card will bring you by early mail, Dibble's Farm Seed Catalog, the leading Farm Seed Book of the year, Samples for testing if you ask for them, and Dibble's Special Price List

quoting **Freight Prepaid** prices. Thousands should answer this ad. Write your postal now.

Yours for the best seeds that grow, at live and let live prices.

The Cultivated Blueberry

How to Grow Them in Every Garden

EDITOR'S NOTE—A few days ago we were visiting with a man who spent several weeks last fall on a hunting expedition in the wilds of Northern Canada, and the outstanding thing he remembered from his vacation was not the deer that he killed or the bears and the other game that he saw, but was instead the literally hundreds of acres covered with a great mass of wild blueberries just ripe to be harvested. He said it was one of the most wonderful sights that he had ever seen in any country. Acre after acre of bushes were loaded until they dropped over with the luscious fruit, almost as large as the end of your finger, all going to waste except for the comparatively few that were gathered by the birds and bears. During the fall the bears get into these great patches of blueberries, and with one sweep of their paw, gather a great mouthful of the fruit, which makes a large part of their diet for several weeks.

There is no finer fruit in the world than the blueberry, or as many of our people know it, the swamp huckleberry; but comparatively few folks know that it can be made to grow easily and produce well in the farm gardens. You will be interested in the following article by Mr. Kelsey on how to cultivate the blueberry both as a garden and a commercial proposition.

THE so-called "cultivated" blueberry is of course nothing but our common wild species, as found in swampy places from Maine to Maryland—and farther west and south where there are favorable conditions, and for this reason no one need hesitate in trying them in a small way. In hundreds of widely dissimilar locations the new-found, mammoth, named varieties are growing and fruiting most promisingly—it is only as a commercial crop, that there are still grave doubts.

Joseph H. Putnam, a man of wide observation on Hudson Valley and Litchfield County soils, at the present time agricultural agent of Franklin County,

Massachusetts, states:

"We have not yet had sufficient experience with the cultivated blueberry to be able to express an opinion as to its commercial value. As I saw them growing on Miss White's place at Whitesbog, N. J., it seemed to me that they would be very successful commercially, good for from \$500 to \$1000 per acre, annual crop.

"We have them planted in about every conceivable situation in this county, from the sour hills of Wendell to the Connecticut River Valley, and have had no difficulty at all in transplanting them, as nearly every plant has lived and grown. Some of these are growing in blueberry pastures set in the sod; others in cultivated land of the same type as the native blueberry; others on garden land in the Connecticut River Valley; and so far, reports are unusually unanimously favorable.

"The fruit as it has grown here on budded bushes in Wendell and on cutting plants in my own garden has been fully up to the size that they have reported."

My Own Experience

I have, personally, faith in the ultimate com-

By DAVID STONE KELSEY

mercial success of this splendid berry under cultivation, even though my own experiments, which began on my father's farm in 1881 (central Connecticut) were for years in many ways disheartening. From the original "high bush" blueberry (which I had selected for experiment after many weary leagues of tramping) I at one picking gathered seven and one-half quarts of practically all half-inch fruit, very light blue, firm and of splendid quality. But in spite of propagating experiments that were at first favorable, we finally lost the whole lot (1896) in connection with an orchard we then owned in Saratoga County, New York. The soil was probably too good for them.

Copyright, 1925, by Joseph J. White, Inc.

Capping and packing the fifty cent quart baskets of half inch fruit in a commercial plantation, New Lisbon, New Jersey.

Blueberry A Garden Success

Probably the oldest established planting of cultivated blueberries, outside those at Whitesbog, is at the Cranberry Experiment Station at East Wareham, Massachusetts, under the direction of Dr. H. J. Franklin. Dr. Franklin asserts his belief that the cultivated blueberry is bound to be a garden if not a commercial success, provided only that the necessary peaty or acid soil can be found, or obtained by transportation.

As there is no difficulty whatever in successful transplanting, and no very serious one to the skillful gardener in propagating the plant by cuttings, it leaves the question solely one of a favorable choice of soils and of the considerable investment demanded.

Get Bulletin 974

The first determined and successful effort to cultivate the "swamp huckleberry" was undertaken by Dr. Frederick V. Coville, chief botanist of the U. S. Department of Agriculture in 1907, and the first bulletin upon this industry was issued in 1910, followed by a much more comprehensive one in 1921 (No. 974).

How To Set the Plants

The plants may be set out either in early fall or early spring, although it is not advisable to ship them distantly in the fall, as the best time

for fall planting is late August to mid-September. Favorably set at this time, the transplants will throw out a vigorous white-root growth in the new location before winter if set, as they should be, in warm, moist soil.

The planting distance recommended is eight feet by four which permits one-horse cross-cultivation the first two years. Mature plants ultimately reach a height of from four to six feet with a spread of about equal distance.

Pruning is a simple matter, the only imperative rule being that, for the first two springs after setting, all flower buds should be rigidly removed—before they open. As younger wood produces the best fruit, removal of part of the old wood should be gradually begun after four or five years.

Few Diseases

So far, diseases and insects are almost negligible. The fact that blueberries do not require spraying should bring a sigh of relief to any planter.

In common with most other fruits, blueberries will not set a good crop unless two varieties are planted side by side, but inasmuch as the experiment stations are now giving out reports upon at least twelve named varieties, there is no trouble in this direction.

Needs Acid Soil

The requirements of blueberry culture are an acid soil, preferably containing peat or the muck of thoroughly decayed vegetable matter, an abundant supply of soil moisture, yet combined with good drainage. The plant cannot abide any suggestion of free lime, alkali or even sweet soil which re-

sults, even on sour land, from the free use of stable manures or calcinated fertilizers.

The blueberry plantations in southern New Jersey are located upon distinctively sandy land that provides the necessary moisture content with perfect drainage. The blueberry insists that the moisture supply be well-balanced, but this may of course be obtained by artificial drainage in wet locations, and systematic irrigation where opposite conditions prevail.

Fertilizers Needed

Notwithstanding their wildness and preference for an acid soil, commercial fertilizers are freely used, the rate being about 400 pounds per acre and the formula the same that is recommended by several experiment stations as especially suitable for cranberries, namely:

Nitrate of soda	100 lbs.
Sulphate of potash	40 "
Finely ground high grade rock phosphate	260 "

400 lbs.

This mixture analyzes about 4-18-5. Acid phosphate may be substituted for the raw rock phosphate, but is not so good. This application of fertilizer is made at the time of first

VOL. 115 March 7, 1925 No. 10

A Good Garden is Half the Living

FARMERS sell their products at low wholesale prices and buy most of their supplies at high retail prices. There is one way to beat at least part of this unfair system, and that is to return somewhat to the ways of our fathers by making the farm itself supply more of our own needs. That is both practical and possible. Very few of us realize the possibilities of keeping down feed costs by growing more clover and alfalfa. Thousands of farmers buy butter, and worse still, oleo; thousands more use too little milk; and not one of us in a hundred knows the pleasure and profit that come from home grown beef, pork, mutton and veal, all of which can be canned and kept fresh the year around. It is safe to say that there is not a farm in the East that will not grow at least some kind of berries and small fruits.

And it is possible on every farm to have a good garden.

Dr. G. F. Warren of Cornell estimates that with a little more planting and attention, enough can be saved on home grown products on every farm to more than equal what is paid out in taxes. And that is some item in these days!

The saving is not the only thing either, for the home grown stuff is better in quality than anything that can be bought. We have heard farmers say that they "have no time to fool around with a garden;" but let us not forget that when we are "fooling around with a garden," we are working for ourselves and that when we are working early and late in the barn or field our labor too often is not for ourselves but for the middleman.

A garden is necessary in good times. It is especially necessary when the difference between what the farmer sells and what he buys is so great as it is now.

New Knowledge for New Problems

THE Indians claimed that the white men brought the weeds, and they were right. Moreover, not a year goes by that there are not several new weeds added to the long list which farmers have to fight. The same is true of insect enemies. Older farmers can remember when there were few or no potato bugs; San Jose scale is of comparatively recent origin; and the corn borer and other dangerous pests have only been in America for a short time. When it comes to diseases, our grandfathers did not have to worry about bovine tuberculosis and a dozen and one other diseases which now constantly

threaten our business and increase our costs of production.

All of this means that modern farming has become a vastly complicated business and is growing more complicated and difficult every year. Without scientific knowledge to combat all of these enemies of agriculture, farming would soon yield to the ravages of disease, insect and weed pests. The colleges of agriculture, the experiment stations and the department of agriculture are constantly studying our problems and devising new ways to meet them. But knowledge is not much good stowed away in a report or locked up in a dry bulletin. It must be gotten to the busy men on the soil who face their problems every day. Farm papers are doing this and so are the farm bureaus.

Few of us realize what the Farm Bureaus have done in getting this practical knowledge to us. Farm Bureau men live right in the counties. They know what YOUR problems are, and what knowledge is practical on YOUR farm and in YOUR county. They are the agents that bring to you, in the form in which you can use it, all of the research knowledge that the thousands of scientists are constantly developing about agriculture.

Of course, these Farm Bureau men are human and make mistakes, but the help that they are rendering, in keeping down the costs of production and thereby increasing the average man's chance of making a living, is tremendous. AMERICAN AGRICULTURIST wishes that every farmer could see his way clear to join his county Farm Bureau and every woman the Home Bureau, and then constantly use them in solving the many problems that develop on their own farm. But whether you use them or not, they are right there working all the time for the farmers' interests.

Too Many Potato Varieties

IN A recent speech in Fulton County, New York, Professor E. V. Hardenburgh of the New York State College of Agriculture, said that there were altogether too many groups or types of potatoes. "There are in all," he said, "at least twelve different groups, every one of which is at present being grown in Fulton County."

He suggested that no one thing would help potato growers more in their marketing problem than to standardize their varieties down to not more than three, and exclude all others. Prof. Hardenburgh mentioned as the three varieties he would choose the Irish Cobbler, as a good early type, and the Rural and Green Mountain, as late types. The Green Mountain is more susceptible to drought and disease than is the Rural, but is of high quality. The Russett is the same as the Rural except for the skin. The Green Mountain is probably the best type for a light soil.

Mr. Hardenburgh said that the best protection against running out varieties and disease is to use certified seed. Results of demonstrations over a period of six years show that the certified seed outyielded common stock by an average of seventy-six bushels, or forty-three per cent.

Go Slowly on Bean Acreage

IT IS always dangerous to make suggestions to farmers as to what their acreage on any particular crop for the coming season should be, for Old Man Weather may step in and one way or another overcome all of the facts upon which the forecast is made.

But the knowledge at hand now indicates that bean growers should proceed with some caution in making plans for the coming season. The consumption of beans in this country averages about fifteen millions bushels. When production exceeds this, growers stand to lose. If the Western states plant their usual acreage this year, and the other bean growing states plant the same acreage that they did in 1924, we would produce, with an average yield, two million bushels more than this country would consume. Therefore, it would

American Agriculturist, March 7, 1925

seem that the present bean prices should not be taken into consideration in making plans, for it is very likely that farmers will be better off if they reduce their acreage instead of increasing it.

What About the Barge Canal?

IN Governor Smith's message to the New York State legislature early in January, he called attention to the fact that the state's barge canal is a white elephant, that it carries far less freight than did the old Erie Canal, and that it is yearly costing many times what the Erie Canal did for operation and maintenance. The Governor suggested that a temporary commission be appointed to make a study of the canal to determine what, if anything, could be done to stop the steady outgo of the State money for maintaining this nearly worthless big ditch.

Legislative leaders have also shown that they are alive to the situation by introducing a resolution calling for the appointment of a commission of thirteen members to make an investigation of the administration and operation of the Barge Canal. The whole thought is to determine what can be done to increase the usefulness of the canal. We know that every farmer will be thoroughly in sympathy with the idea that it is high time steps were taken to put the Barge Canal on a paying basis.

Corn Seed is Scarce

THE United States Department of Agriculture recently said: "Nothing in the production situation has occurred since 1920 of such significance as this season's short corn crop which will have its effect on the country's animal industries for two years and perhaps longer, a harsh but powerful reducer. It is already pressing sharply on hogs for corn is to livestock what coal is to urban industry."

Let us not forget also that this applies to seed corn and that he who is wise will get his seed corn early.

Albany News on Page 253

EVERY farmer in the State is concerned with the bill for reducing the age limit of boy drivers from eighteen to sixteen years, with the bill for putting a tax on gasoline, and with the bill for keeping the roads open from snow in the winter time. On page 253 there is a most excellent report of the progress of these bills in the State legislature. Don't miss reading it.

Eastman's Chestnuts

ONE of the hopeful things that has come out of the European chaos following the World War is the better feeling which seems to prevail between Ireland and England. There have been concessions on both sides with the result that the situation now seems to be better than it has been before in many centuries, for since time immemorial there has been no love lost between Irish and English people. There are many good stories that have come out of this situation, one of the best of which was recently sent me by an English friend who enjoyed the point in spite of the fact that he is an Englishman.

A British soldier, who had been badly mutilated in the World War, having lost both arms and both legs, was propped up in one of the busy thoroughfares in London, soliciting alms. One day an Irishman chanced to come by, and seeing the Englishman in such a shape stopped, looked him over, and then dropped a shilling in his pail and passed on.

But he was soon back, looked him over again and dropped another shilling in his pail. As he repeated this the third time, the Englishman said to him:

"How is this, you have looked me over three times and each time you have dropped a shilling in my pail?"

"WELL," said the Irishman, "I'LL TELL YOU. YOU'RE THE FIRST ENGLISHMAN THAT I EVER SAW THAT'S BEEN TRIMMED TO ME LIKIN'!"

A Good Garden is Half the Living

Good Gardeners Tell How They Do It

PLANTING time in the spring always comes with a rush and there is little time for planting and getting things ready. During this month is the time to decide just what vegetables, and how much of each you will endeavor to grow and get seed, fertilizers, etc., on hand. Do not wait until a few days before planting time and rush an order to the seed house the last minute. They are rushed to death. If an error should be made, you will be late in planting just what you wanted, and the chances are you will have to take either substitutes. There are always hundreds of others who also have been putting off ordering their seed supply until the last minute, and although the seed houses work day and night they cannot fill orders fast enough. If live plants are ordered in advance they will be sent at the proper time, pro-

vided you advise the nurseryman to do so, while if you wait until planting time the supply will probably be exhausted.

Climate Affects Time of Planting

Most farmers know what varieties must be planted early, while the soil is cool and moist, and what sorts will fail to germinate if planted before the soil has become dry and warm. Garden peas, lettuce, spring turnips, mustard, radishes, may all be planted quite early.

Some frost and even a mild freeze does not injure these, especially if protected by a thin covering of leaves, or hay. When the sun comes out, they will grow right ahead and be ready for the table several days in advance of those later planted.

Among the flowers which require very early planting for best results are the pansies, pinks, sweet williams, and few others. This information is usually given on the seed package and repeated in the seed catalogs, which may be had for the asking. These books also give many useful hints as to cultivation and location best suited to best development of vegetables, fruits and flowers. Study the catalogs before planting time arrives. The condition of the seedbed is of great importance in the growing of vegetables and flowers. Most seeds are so small that unless planted in a smooth, well pulverized soil they will not germinate satisfactory.

Fit the Ground Well

The land should be plowed, harrowed and raked until well pulverized to a depth of several inches and with the surface as level as is practicable and free from all obstructions such as clods, trash, etc. It is always a good plan to provide fine, well-rotted manure or scrapings from corners of the lot, or fence corners, to cover the small seeds such as beets, lettuce, turnips, etc., especially if the garden soil has a tendency to pack, as many soils do.

It is well to study the character of the garden

Buy Only the Best Seeds

Buy only the best seeds. The difference in cost between good and cheap seeds is small and it never pays to take the risk of a failure in the vegetable garden from using inferior seeds. Order enough for successive plantings of each vegetable.

Grow a variety and plan for rotation to keep up a supply throughout the growing season. The season of most vegetables may be extended through the entire growing season by planting at intervals, thus having a supply of fresh, tender vegetables from early spring until frost with plenty to store away for winter use. It is always best to stick to tested varieties for the main crop. While some of the newer sorts may prove a success one never can tell until they have been given repeated trials.

It sometimes happens that climatic or soil conditions determine success, or failure, of some garden plants. When to plant depends on location and condition of soil. Here in New Jersey we find it best to make the first planting of seeds of early hardy vegetables along the middle of March, provided the land is dry enough to get the proper condition for planting. Earlier planting may suffer from freezes which may seriously injure the tender plants, and some seasons we plant the first week in April.

C. A. UMOSELLE, New Jersey.

Why Not Try Okra?

IT seems strange that okra is so seldom seen in average garden. It is strictly a southern grown vegetable, but it will thrive in any soil or climate. I am sure it would find a welcome place in all gardens were its superior qualities more generally known. It will stand an excessive drought without wilting a leaf, in fact the hotter the sun the faster it will grow. It will begin to bear edible pods when less than a foot high, and will continue to grow and bear until frost lays it low. The pods grow quickly and should be cut when quite small—as they grow tough and stringy if left on the plant. It will also cease bearing if the pods are allowed to ripen.

The okra seems to be immune from all insect pests, and will stand neglect better than any other garden plant. The pods should be boiled in salted water about ten minutes, then fried a delicate brown. They have a delicious flavor and are decidedly nourishing.

There is a Government bulletin issued on the culture and uses of Okra, which is fully worth the trouble of sending for it.

MRS. M. N. WILCOX.

Grow Some Parsley For Seasoning

PARSLEY seed germinates slowly and the seedlings are fine and this causes so many to fail in growing it that it is not as popular as

it deserves. If we will use more care in planting we can have it. We do not need many plants to give all we will use, and by giving a small bed special preparation we can get the plants established all right. It does not transplant well, so if we try to grow in boxes we must be very careful in setting it out later. If we will heat some soil steaming hot and spread it on the surface of a bed to the depth of an inch it will have no weed seeds coming up until the parsley has time to get well started. As a half dozen plants will do very well a bed two foot square will be ample and can be given some watering later to give better quality in dry weather. Make the soil rich with rotted manure.—L. H. COBB.

Does It Pay to Sow Lettuce Thickly?

WE get so used to sowing lettuce seed thickly in the row and then pulling it or picking the leaves we do not realize how much better it is if planted thinner so each little plant can have room to develop rightly from the start. The leaves are just as tender and crisp and have much more substance, and their greater size makes for much nicer handling. A limited number of strong plants where the leaves are picked promptly will remain productive of fine quality leaves for a long time, while the crowded row will become tough. I never have enjoyed picking over the little leaves where it has been pulled up from a thick mass and when it is as easy to have the plants given plenty of room to develop there is no need for it. Give room and fertilizer and your lettuce bed will be much more satisfactory to you.—R. RAE.

Radishes In Succession

RADISHES to be good need to be grown quickly and used before they are very old. The small turnip and French Breakfast types have small tops and mature quickly, though many think they are not worth the ground they take, but we can sow the seed in the same row with the icicle and pull the small reds before the icicles are ready. They will be very useful grown thus and take no more row than the icicles would alone, and not check the icicles in the least as they have somewhat heavier tops and claim right of way. Radishes should not be planted too thickly anyway, for quality is sacrificed with the long white sorts if they are crowded, and if you

And When You Plan Your Garden Do Not Forget the Pleasure That Comes From the Flowers.

give them the room they need the little reds will have plenty of room to make good between them. I aim to have about an inch between seeds if my soil is rich, reds and whites alternating.

L. HILLARA.

A garden is a beautiful book, writ by the fingers of God; every flower and every leaf is a letter.—DOUGLAS JERROLD.

"Success does not depend so much on external help as on self-reliance."—LINCOLN.

here's The Corn-

"Lancaster County Sure Crop" Variety

Talking about real value—"Lancaster County Sure Crop" is a corn that has it! Not always a show corn, or blue-ribbon winner—but for general all-around use—here's the Corn! You should have our Catalog, and read more about this Corn and the nine other kinds offered. This Book is FREE—write for it today!

Fills the Silo

"Lancaster County Sure Crop" corn does this right along—year after year. In good years and under bad conditions. Grows a tall, very leafy stalk. Develops early. Withstands drought. Will develop corn well to the North. Makes a richer ensilage than most other varieties. Used for more silos every year, and over a wider territory than ever.

Fills the Crib

It paid many an Eastern farmer to have Lancaster Co. Sure Crop last year. It came through with a good crop of hard corn, while many other types didn't! Matures early, husks easily. Shells extra well. Rich in protein. Suited for rough and ready culture. Don't require the richest soils. Pleases and pays its growers.

Good, Sound Seed Corn—Tests 92% to 98% germination

Ten kinds of it—brought into our warehouse last fall, hung on racks, dried right, cured right, cleaned clean. Tested and sound! Scores of recent tests showed above percentages—all because of the right kind of care it received. But it's all for your benefit! Planting such seed will pay you—anyway in such a year as this one is!

Costs You Only 50c an Acre!

Yes, that's all! What other farm-crop can you plant at such low cost? And think of what good sound Seed Corn will mean to you, rather than taking chances on doubtful seed. Buy our Seed Corn from this List, and start right for your 1925 crop.

New Catalog FREE

It lists Seeds for all the other Farm Crops. Oats that yield extra well—"side" oats and (sprangle) types, seven kinds. All the Clovers, and hardy Alfalfas. Barley, other Grains, Pasture Grasses, Soy Beans, Field Peas, Seed Potatoes, Seed Inoculation, etc. etc. Just mail your name and address on a Post-Card. Do it now—and be sure you look through this Book before you order your 1925 Seeds. You'll find it's going to pay you!

Vegetables for Cash Crops

Maybe Truck Will Add to Your Income

THE agriculture in territory near

by PAUL WORK

on the Syracuse market, trucks act.

great cities tends to produce the commodities for which a short haul to market contributes the greatest advantage. Thus New York is no longer a wheat state, but has become a great fluid milk state and a great vegetable state. The tendency to grow the perishables nearby is strengthened when soil and climate also favor.

That New York is a great vegetable state is evidenced by the 1919 census figures which place it at the head of the

list when potatoes are included and second in the list when they are omitted.

We would expect New York to be a great state in production for local market. It also ranks high among the shipping states. Figures for 1924 show California and Florida far in the lead, but New York stands with New Jersey and Texas in the next group and its products reach markets a thousand or fifteen hundred miles away.

Another fact that will surprise many is the rapidly growing importance of vegetable crops in

Growing Vegetables A Big Business

THIS is the kind of article we like to print in American Agriculturist. It is progressive and forward-looking, with every statement based on actual facts and good common sense. Professor Work, who is connected with the Department of Vegetable Gardening at the New York State College of Agriculture, is well known to readers of American Agriculturist.

Farming in all of its branches is a constantly changing business, especially near these big cities here in the East, and those farmers who do the best will be those who are best informed on the changes in the conditions in the market and who fit their business to meet the new conditions. There may be a suggestion for a cash crop in this article which will add to your income.—The Editors.

general farm and dairy counties. Potatoes and cabbage have long been prominent in these counties, but Madison has become one of the great pea-shipping sections and the land-locked coves of Delaware are doubling their cauliflower acreage each year, and are looking about for new crops to conquer. Even Jared Van Wagenen, dyed-in-the-wool dairyman that he is, acknowledges a welcome bit of income each year from an asparagus patch.

These are some of the facts and they lead us to ask, "Why so?" and, "What of the future?"

The vegetable world is fast changing. Its crops were formerly left wholly to the intensive market gardener very near the city. His short team haul, his city manure supply and his access to ready labor made him able to produce a wide variety of crops to better advantage than his more rural brother. Market garden lands are now being built into city blocks and the market garden is replaced by another type of vegetable production. Even Irondequoit, famed through many states as one of America's three best garden centers, is fast passing and there will never be another like it.

Modern Transportation Changes Order of Things

The motor truck and the refrigerator car are making it possible for the farmer who is not so near, but who can grow one or two crops cheaply and well, to compete on favorable terms at the Wallabout market in Brooklyn or at the Elk Street market in Buffalo. Ontario County is growing cucumbers and asparagus; Wayne has added carrots to its celery, onions, and lettuce; Niagara is back to the muskmelon game; all because the new era of transportation enables their farmers to take advantage of peculiarly favorable conditions of soil and climate, of cheaper land and ample space for manurial as well as market crops.

Nevertheless, the conditions are not so peculiarly favorable as to bar the keenest competition. If lettuce is high

usually roll from Erie County a hundred and fifty miles away, and if it is cheap at Syracuse, buyers take the surplus to Albany. Thus there is in progress a great evening up of supply and demand, tending to balance a glutted market against another that is starved. Moreover, there is now free flow to smaller consuming centers. A Syracuse concern maintains a retail fruit and vegetable store in Ithaca and trucks make daily trips to keep its counters piled high.

Greater Demand for Vegetables

Farmers welcome the opportunity to grow cash crops and there are new competitors every year. Population grows; the proportion dwelling in cities increases. Teachers, lecturers, settlement workers, magazines and newspapers all preach more vegetables and the growth in total consumption far outstrips the growth of population. The Vegetable Growers' Association of America is a booster for vegetable advertising and the National League of Commis-

sion Merchants plans launching a two or three million dollar campaign to popularize vegetables and fruit. Twenty-eight thousand cars of lettuce marked a disastrous season of oversupply in 1923 and twenty-nine thousand cars rolled in 1924 to much more even absorption with a correspondingly better price situation. Yet little is to be expected by way of high prices in the future. Success will be based on cheap production, not on favorable market quotations. This fact points the way to real prosperity for those who are able to master. The competition of the high-cost man must fade. This will be increasingly true as accounting spreads and farmers learn to kill a crop" as well as "kill a cow" when either fails to make a strong case at the annual casting up of the balance sheet.

A Word of Warning

Hercin lies a word of warning. None need launch upon a new enterprise unless he is sure his conditions are right and unless he is prepared to go the limit in learning and supplying the needs of his crop, and this at minimum cost. As Eastman implied a few weeks ago, there is and will be little sympathy for the cry of the lame duck who wails: "I could make money if prices were what they should be." There are too many nimble-footed ducks whose heavy yields cheaply produced will swell the supply and keep prices low enough to move great quantities into the ever-widening channels of consumption. Gardening as well as dairying "is now a business."

How to fit crops to conditions is the problem of the present, as well as of the would-be vegetable grower. Each crop must be studied and its preference as to soil and climate must be learned. These facts must be matched with the farmer's own situation. 1. The demand must be estimated both as it is and as it is likely to be. Lettuce and celery and cauliflower have stepped forward faster than the more staple onions, cabbage and potatoes. 2. Consider also the season of maturity in relation to shipping seasons of other producing regions. Texas spinach is market-

The Lesson of Lean Years

Lean years—such as those passing—often lead to long profits because of the lessons learned in cutting the cost corners.

Progressive farmers have found that good farm machinery, particularly the tractor, does more to reduce costs and increase yield than any other one thing.

With the Fordson they have found that they can not only do general tillage operations faster and better, but can use it for belt jobs and routine work of all kinds at a big saving in both time and effort.

So it is no wonder that farmers generally are facing an era of better prices with every confidence that the things they have learned in the lean years are going to lead to better profits in the better ones ahead of them.

Time Tested Windmill

The Auto-Oiled Aermotor has behind it a record of 10 years of successful operation. In all climates and under the severest conditions it has proven itself to be a real self-oiling windmill and a most reliable pumping machine.

An **Auto-Oiled Aermotor**, when once properly erected, needs no further attention except the annual oiling. There are no bolts or nuts to work loose and no delicate parts to get out of order.

There are no untried features in the **Auto-Oiled Aermotor**. The gears run in oil in the oil-tight, storm-proof gear case just as they did 10 years ago. Some refinements have been made, as experience has shown the possibility of improvement, but the original simplicity of design has been retained while greater perfection of operation has been achieved. The **Aermotor** is wonderfully efficient in the light winds, which are the prevailing ones. The self-oiled motor works with practically no friction, and the wind-wheel of the Aermotor is made to run in the lightest breeze. It is also amply strong to

run safely in the strongest winds. In any condition of wind or weather you may be sure that the **Auto-Oiled Aermotor** will give you the best of service. It is made by the company which established the steel windmill business 38 years ago.

What Is A Farm Without An Orchard?

R. L. HOLMAN

SPEAKING from my own experience I find that raising an orchard for home use is a very simple matter. In fact, I don't know of any thing that can be more easily handled in the system of farming as practiced by the average farmer.

My own orchard has required very little of my time away from other work. It took only about a half day to set out enough trees to last me the biggest portion of a life time. The attention my orchard needs such as pruning, spraying, etc., does not require as much time in ten years as the same spot planted to a garden would require in one. Yet, none of us would be without a garden, though I doubt if the garden, either from a money making standpoint or for the supplying of home needs gives as good results.

Then again, the ground taken up by my orchard has not been useless for other purposes. It has been planted or sown to other farm crops, not only while the trees were getting ready to bear but afterward. In view of these facts, I often wonder what excuse the average farmer can offer for not having an orchard. I notice huge number of them do not have a sign of a fruit tree and the most universal excuse I hear is that it takes too long for the trees to begin bearing. It does take longer than is ordinarily required with other farm crops, but we have to pass that time away any how so why not let the trees be growing?

Planned for the Whole Season

In setting out my orchard eight years ago I got trees of several different varieties so as to have fruit throughout the entire fruit growing season. Then planned for several different kinds of fruit. I set out apple, peach, plum, cherry, apricot, crab apple trees and a number of grape cuttings. I also set out strawberry and raspberry plants and have renewed these whenever necessary to keep us the supply.

You can image how good it makes one feel to be able to pick his own supply of fruit off of his own trees. We have enjoyed these thrills from the time our first peach trees began to bear about three years after they were set out. We have enjoyed the pleasure of seeing the fruit come in increasing amounts year after year as the different trees began to bear. This year our young cherry trees for the first time gave us enough cherries to make several cherry pies. Our plum trees were loaded for the first time with big juicy Japanese plums, and we made some plum jelly. We are also beginning this year to put away some grape juice from our own vineyard. We got more pleasure in gathering the three last named fruits than any other because they are such a rarity in our neighborhood.

Home Orchard Saves Money

As for apples and peaches we will have them canned and preserved in abundance this year. We have sold our surplus fruit but as we planted our orchard for our own use we are not banking on it as a money making proposition except in the money it saves us.

This year I have a splendid crop of soy beans in my orchard growing all around my trees. The beans alone will give me as big a return per acre as any other spot of equal size on the farm and so I feel like my fruit is almost clear profit.

Trimming Old Trees

How shall we trim old Baldwin trees?

Prune them like any other old trees with allowance for the nature of the varieties. Remove all dead wood and suckers, head back if necessary, thin the small branches at the ends of the big limbs and cut out crossing or interfering branches. Read Cornell Bulletin 415.

Is a Saving of \$50⁰⁰ Interesting to you?

ARE you using this Catalogue? Do you and your family use every opportunity for saving money that this book has brought into your home?

Try This Plan for Saving

Every time you need to buy anything for your own personal use, for the family or the home, look it up in Ward's Catalogue. Take advantage of the saving.

Then keep a list of everything you buy and the amount you saved. Thousands of our customers do this, and frequently they write us, "My savings in buying at Ward's amount to at least \$50.00 cash each season."

How Ward's Low Prices Are Made for You

Sixty million dollars' worth of goods have been bought for this book—bought for cash to get the lowest prices. Bought in large quantities to get the lowest prices. Frequently we buy 100,000 pairs of shoes in one order to get a lower price.

And at Ward's the savings made by our big buying, the savings made through our buying for cash, these savings are yours—always yours.

Always Compare Quality as Well as Price

In gathering our vast assortments of merchandise, our buyers search the markets of the world for low prices. But only for low prices on goods of standard quality. We never buy goods to offer you unless they are the kind of goods that will stand inspection and use—the kind that will hold your good will.

At Ward's "we never sacrifice quality to make a low price." We offer no "price baits." We do not sell cheap unsatisfactory goods at any price. Your satisfaction with everything you buy is our first consideration.

Use Your Catalogue—Save Money Every Month

You have a copy of this Catalogue. Use it for everything you need to

buy. Ordering each month from Ward's means a monthly saving. \$50.00 in cash will soon be saved if you use your Catalogue for everything you buy.

Everything for the Home, The Family and the Farm

Every Woman, young and old, will find this catalogue of interest. Have you studied carefully the big department of shoes for every member of the family? Have you studied its New York Fashions? Do you realize that this book offers nearly everything you buy to use or wear at a big saving?

The Man and Boy will find this book of great value. Whether you are interested in tires or accessories for the automobile, or in radio, in stylish, serviceable clothes, or work clothes, or hardware, or tools, always Ward's Catalogue offers you a saving.

The Home has many needs. It needs most of all to be made comfortable and beautiful. Ward's Catalogue is a real Home-maker. It offers everything new and beautiful and pleasing, the newest in curtains and rugs and furniture, everything that goes to make a house a home.

Your Orders Are Shipped Within 24 Hours

Your order will be shipped within 24 hours. We appreciate your orders at Ward's and we give your orders immediate attention.

But more than this—one of our six big houses is near you. Just consider how much less time it takes for your letter to reach us—how much less time for your goods to get to you and how much less the cost of transportation. It is quicker and cheaper to order from Ward's.

Continued from page 237

cultivating in spring. If the soil is unusually peaty, less manure is required.

If cultivated in both directions, little hand hoeing is necessary, although small plants should be worked about two or three times each year—enough to provide a rust mulch and keep down all weeds until mid-July.

Yields and Prices.

It is better to prevent all fruiting until the third year. Under the most favorable conditions, 50 to 60 32-quart crates per acre should be expected the third year, and these figures increase until the plants are at least six years old. As to the age of a plantation, the oldest known are, so far, but twelve years old and still going strong, while wild plants are known to have fruited consistently for over fifty years.

As to markets and prices, so far the fancy markets have been wildly struggling for the privilege of paying from \$10. to \$12. per crate wholesale, the fruit retailing at from 40c to 55c per quart. As all the attractive qualities of wild blueberries are retained in the improved, cultivated fruit, the already waiting market is sufficient to consume all that can possibly be produced on many thousand acres. The blueberry is firm and solid, maintaining itself in perfect condition for shipping for several days, and resisting adverse conditions almost equal to the currant.

Fern Balls for Pin Money

If one lives along a much travelled auto route or near a filling station, extra money may be earned by the making and

selling of fern balls.

Get as many small sponges as you wish to make balls, and taking one of these as a foundation wrap wood soil, secured from the roots of trees, around it forming a ball. Around this wrap roots of small ferns and tiny vines such as the moxie berry, squaw berry, the snake plum vine, and a little fine trailing pine. Hold these in place by carrying a thread of green raffia around then as you wrap the ball, and leave a strand of the raffia by which to hang the ball when it is complete. Sift parsley or carrot seeds into the tiny holes in the completed ball and keep in the shade and well dampened until green and and thrifty looking.

Balls made in this way will keep beautiful all summer and bring a good price. —L. M. THORNTON.

Vegetables For Cash Crops

(Continued from Page 240)

ed between the fall and winter seasons of Virginia spinach. Madison County peas would have little chance in mid-June. 3. Distance to shipping point and kind of roads must be considered in relation to bulk to be hauled. There is sometimes a carload per acre to be moved. 4. Shipping and selling facilities must be weighed. 5. The labor requirement must be compared with the available labor supply. Berries and beans for cannery are good crops for Brant and North Collins, where hundreds of Italians live. 6. How will a crop fit into the general plan of the farm? Spinach likes an alkaline reaction and potatoes are scabby in limed soils. They make poor running mates in a farm rotation. 7. Is the crop difficult or easy to grow? The difficult ones are best—for him who is

willing to master their management. The easy crops are likely to be in greater oversupply and had better be left to the easy-going fellows unless one is prepared to offer them when others are off the market or is able to surpass in quality and service.

More vegetables will be eaten every year for some time to come. The enlarged demand will not be best met by increase in acreage or number of growers, but rather by increase in efficiency and in yields on the part of producers who are ready to take advantage of every advantage toward better seed, better fertility, better pest control, better marketing service. Institutions and growers organizations are helping in these directions and there are still opportunities for eastern farmers to make vegetable crops contribute to the relief of the economic stress that has for five years beset our whole agricultural structure.

Selecting Garden Seeds

MOST people depend on the seedsmen for their seeds rather than to take the extra pains and labor necessary for saving them at home, and ordinarily this plan is to be recommended. The seeds which are saved for this purpose by men who are continually at this work are more likely to be satisfactory than those saved by the average owner of a small garden. The selection, cultivation and curing are all done by experts with the different crops who can make use of an amount of knowledge not possessed by others and it is well also to lay out your garden plans and order your seed early.

It frequently happens, however, that the owner likes to save some seeds of his own. He has favorites among the plants in his garden and finds pleasure

in propagating them. The products of such will yield a satisfaction not otherwise to be obtained. A row of lettuce, a hill of corn or potatoes can never mean as much to the man who merely plants the seed he has bought as it does to the one who has been acquainted with the ancestors of these plants for generations back.

Choose Varieties For Purpose To Be Served

It is first important in raising seed, to determine what feature of the plant is to be kept in mind. Is it to be improved in earliness, productiveness, size, quality or hardness, or is it to be termed an "all around" plant? One which is to retain many good features without sacrificing some to emphasize others? However, this may be, a course should be determined upon and this kept constantly in mind. In selecting the fruit for seed it is not enough to make a choice of a single specimen; this may be a freak and really not desirable. The first ripe tomato may be borne on a vine which produces all its other fruit comparatively late. A single pepper may be extra large, though the others on the bush are small and so on throughout the garden. The single specimen is not a reliable guide to go by, but the value should be judged by the whole plant and what it does. In growing plants for this purpose the selection for seed should be the first consideration, and the plant reserved for seed should not be called upon to supply the table also, but allowed to give all of its strength to maturing the seed. In this way the best only will be saved and this variety should be kept improving.

—V. M. C. Tompkins County, N. Y.

F. E. ROBERTSON

SOME 1,600 sheep growers in New York state have been engaged in cooperatively grading and marketing their wools each year since 1920. During those five years they have handled over 2,495,800 pounds, or about 500,000 pounds each year. With this period of experience behind them they may well take time to consider whether after all the principles of cooperative marketing as applied to the grading and selling of wool direct to mills is more to their advantage than the old practice of selling ungraded clips to the local dealer for cash.

When a large number of individuals undertake to assemble and pool their product subsequent to having it properly conditioned for sale they voluntarily assume the details and expenses incident to warehousing, grading and marketing. In brief through their organization they elect to set up the necessary machinery to perform this service; they assume the risk that was formerly carried by the local dealer, and expect to control their own marketing.

The Element of Time

Engaging in such an undertaking the first situation confronting them is the time element required to prepare their product for market. The individual does not receive cash in hand on delivery of his product to the cooperative assembling point. It is possible, of course, for the individual to receive a partial payment if desired but the final settlement cannot be made until the product has been sold and the accounts figured. The individual sheep grower who elects to participate in a cooperative undertaking voluntarily assumes the risks and possible delays in selling the product, and he does this in the hope that his final net returns will justify the belief that the farmers can successfully market their own crops.

Cooperation on Prices

It is not always easy to accurately compare the average net prices obtained from wools sold cooperatively direct to mills, with the average range of prices paid by local wool buyers for the wool buyers pay in every instance. If the wool buyer is a keen business man he will endeavor to buy at the lowest possible price and will pay less where there is little or no competition. His success depends on his being able to make a good purchase. The following facts are given to illustrate the difference between the price farmers actually received for wools sold cooperatively, with the range of prices paid by local wool buyers:

	1920	1921	1922	1923	1924
Average sale price per lb. c	36.3	36.3	45.3	49.5	53.5
Average overhead exp. per lb. c	4.3	4.1	3.7	4.3	4.8
Average net all price wool c	32.0	32.2	41.6	45.2	49.3
Local buyers price range	16-24	16-24	28-35	35-48	35-45
Saving through cooperative grading and selling c	8-10	8-10	7-12	3-10	6-15

In studying this comparison it must not be overlooked that the range of prices paid by local buyers was undoubtedly higher than it would have been had there been no local competition from the cooperative association of sheep growers. Therefore the difference is not as wide as it otherwise would have been. Wool buyers react to competition when it is necessary.

Success Up to the Membership

In the final analysis the proof of the success of cooperative marketing rests with the farmer members. They assume responsibility when they participate with their neighbors in the undertaking. If their motive is entirely selfish, and the majority of the mem-

bers are of that same state of mind, the chances for success grow slim for the reason that there will be too much fault finding and petty criticism.

Insofar as the marketing of wool is concerned the sheep growers of New York seem well satisfied that they are making progress. They have done well during the past years, and on the strength of this experience they are planning to campaign for additional members in their several county associations, for the greater the volume of wool handled the lower the cost per pound will be. In addition to obtaining good prices for their wool they know that they have helped create a reputation for well graded New York wools and this in turn helps to make a greater demand and better prices. In brief wools are being marketed cooperatively in New York state with very good success.

UNITED STATES TIRES ARE GOOD TIRES

(11) 245

U.S. Royal Cords

THE makers of Royal Cords present these facts and ask you to consider where you can reasonably expect to find more tire service for your money.

1. Construction

Royal Cords are built of the new Sprayed Rubber and Latex-treated Web Cord by the Flat Band Method.

These three major improvements in tire making, developed, patented and owned by the United States Rubber Company, have added materially

to the uniform quality and service of these famous tires.

2. Resources

The rubber plantations and fabric mills of this Company provide an economic supply of raw materials. Strategically located factories and branches cut the cost of manufacture and distribution.

3. Quantity production and fresh stock

The confidence of both dealers and car owners in Royal Cords insures a constant demand and ready sale.

How Much Must a Cow Produce to Keep Her Out of the Robber Class?

THE editor has asked me to answer the question recently submitted to him: "When does a mature cow cease to pay her way and get into the boarder class?"

I think the answer to this would depend of course not only upon the cow but upon the price of milk. During the War there were hundreds of cows that probably paid a small profit which are now being kept at a heavy loss to their owners. I agree with the AMERICAN AGRICULTURIST when it says that the future of the dairy industry is bright, but not for the owner of cows that are on the margin between profit and loss. Most of the time these cows will be on the wrong side, even though there may be a few months at a time when they will make a little profit.

In figuring whether a cow is a boarder or not, her butterfat production must be considered as well as her volume of milk. For instance, a cow that gives 5,000 pounds of milk with an average test of 4 or 4½ per cent cannot be classed with another cow that produces 5,000 pounds of milk with a test of something like 3 per cent.

I would say, however, as a definite answer to the question, that a man with a dairy averaging only 5,000 pounds of milk per year per individual is going to have a mighty hard time of it to make both ends meet, not only in the next year, but for all time to come. The average production in this State is between 4 and 5,000 pounds. Such average cows are not paying now, and they are not likely to pay.

If we could once get in a position whereby we could make people realize what a good food milk is, then dairymen would come into its own again. But at the present time, there are too many cows and too much milk for market demands. Therefore, if many of these cows that do not pay their way were slaughtered and a good high tariff was maintained, the dairy business would again be profitable.—E. E. Roe.

Better Cattle and Better Farm- ing in Noah's Country

SAVING a starved land with selected cattle, hogs, sheep and poultry and an elementary farm school of 1,100 youth who produce as they learn and learn as they produce, is a feature of the Near East Relief's Constructive program that we heartily applaud for its wisdom, economy and promise. America has been a generous giver of food and care for the thousands of orphaned children in Armenia; now it is helping these growing youth to grow their own food, or, as the old farm saying goes, "to cut their own fodder," and, while they are cutting, to cut twice as much.

A Grand Duke's experimental stock farm of 16,000 acres, which is said to be as fine land as is to be found in any state, has been given by the government gratis. One of its barns will shelter 500 cattle. American and Armenian agricultural college graduates are in charge. It grazes some 700 "beef" cattle picked up from the run-out stock available in this skinned and starved country which has been fought over for years and suffered the loss of 80% of its live stock. Out of the "best" of these 100 milking cows were selected. The rest were killed for the once-a-week ration of meat for the vast orphanage of 13,000 children sheltered in the old Army barracks at Alexandropole. Eight Brown-Swiss and Semmental bulls were brought in Switzerland a year ago. These breeds are well suited to these highlands and for the purpose. To build a producing herd 100 good milk and breeding cows are needed. These can be had from Switzerland, Moscow and

INTERNATIONAL SILO CO., Dept. 16, Meadville, Pa.

Bulgaria for about \$100 each. Holstein and Shorthorn bulls are wanted and possibly, Jerseys and Guernseys. These have been offered by breeders of high grade stock in America. Henry Morgenthau, Jr., E. R. Meridith, Dr. D. Hunter McAlpin and others will contribute producing animals from their herds. Cheese making is profitable here as a ready market at good prices is to be had at Tiflis but 120 miles away by rail.

Forage grasses are being introduced, vetch, timothy, clover, alfalfa and corn. Over 4000 tons of native hay was cut last year. Pit-silos provide for green winter feed and will extend the milking season by half and double the production. The best native cows gave but ten to thirty pounds of milk. The improved stock will add wealth to the land. The soil is immensely fertile. From the improved seed brought in beets of 20 pounds and turnips of 24, and 40 bushels of potatoes to the acre have been raised. Quantities of improved seed have been raised and over 1,000 pounds given the native farmers from the surplus. The bulls are at their service.

Women do much of the farm work in all Europe and will here. Therefore it means much that 440 older girls are being trained in the Farm School in the best American methods of dairying, gardening, poultry raising and home-making as well.

The ranch produced 335 tons of grain and 250 tons of vegetables for the orphans living last year. But its best production was hundreds of youth trained to go out into the world as intelligent and thrifty demonstrating farmers and stock breeders. Wherever they may set up their homes on land given them by the government and they will raise a bigger crop by the methods they learned here the neighbors will look over their fence and ask how they did it. This Farm School will last long after the Near East Relief is forgotten, and a better and doubly productive strain of stock will be noted among the "cattle on a thousand hills" in the lands where Noah began his great task of "replenishing the earth" with "two of a kind" and not of as good kind of kine as America and Europe can furnish.

Mr. James C. Penney and Dr. McAlpin assure us of the soundness of the project which has now gone far beyond the experimental stage. It is working well and working good to fatherless children and to an impoverished people. A sum of \$50,000 is being secured for the project in America.

This Herb Is Good Stock Medicine

HOW many farmers gather thoroughwort? We have saved many veterinary bills by using this. As soon as I notice one of my cows or horses ailing I take two or three handfuls of the leaves and stalks, cover with boiling water, set on back of stove, cover tightly and leave for fifteen or twenty minutes, then give a quart two or three times before they eat. Usually three doses straightens them up. This is particularly good for overfed animals and indigestion, also constipation.—H. T. G., Chautauqua County, N. Y.

EMMADINE FARM becomes world renowned through its endowment by Mr. Penny, which makes it a perpetual breeding establishment and outstanding Guernsey Farm.

SUGARED SCHUMACHER FEED

Mr. Dodge, who achieved reputation and distinction during his many years of successful management of that great Jersey breeding establishment, HOOD FARM, where so many great records were made under his supervision, continues to find Sugared Schumacher Feed the most desirable and satisfactory source of carbohydrate for the milking herd, the dry stock, and the young, growing stock at Emmadine Farm.

The Quaker Oats Co., Chicago, Ill.

"It will interest you, I am sure, to know that we are large feeders of Sugared Schumacher Feed, making it the base of our dairy ration and fitting ration. This should be of special interest to feeders and fitters because of the record our herd made in 1924. We won Grand Champion Bull and Grand Champion Cow at the Eastern States Exposition and the National Dairy Show. We have had 26 cows finish A. R. records here on the farm, averaging 11,461 lbs. milk, 588.67 lbs. fat."

Yours very truly, EMMADINE FARM, (Signed), Jimmy Dodge, Mgr.

What better evidence can be presented to you of the economic value of Sugared Schumacher Feed? Give it a trial—your dealer can supply you; if not, write us.

build wisely in 1925

To build wisely—build permanently. Makeshift farm improvements are wasteful; they may prove an actual extravagance.

Concrete, the permanent material, is cheapest in the long run, and its first cost is not high. To make concrete you need only clean sand and gravel or stone, water and Portland cement. Low-priced materials, all of them. Atlas Portland Cement actually costs less today than it did thirty years ago.

For a new barn, or a sanitary floor in the old one—for a corn crib, water storage tank or silo—for a hog house or feeding floor, use concrete made with Atlas Portland Cement.

Of course, you will not use concrete for temporary improvements—but since it is worth while to do most jobs permanently, it is worth while to insist on getting Atlas Portland Cement for the work. Its high quality record during more than thirty years' use on the farm is one of the reasons why Atlas is known as "the Standard by which all other makes are measured."

Send for a copy of "Concrete on the Farm," the free Atlas book on permanent construction. It may help you to save money, to increase your profits, to add definitely to the value of your property.

Weaning Pigs to Advantage

WHEN young pigs are properly handled from the start, they may be weaned to advantage and with no appreciable loss of development and at the same time may be placed on a regular diet consisting of the various feeds that they require.

I have found it is a good plan to give the young fellows plenty of access to a roomy trough and provide them a feeding ground all their own. The pigs will usually begin to eat from the time they are two weeks old, other feeds in addition to the nourishment supplied them by the mother hog. This should be encouraged, giving them fine sloppy material with some ground grain for strength and bone development. These are the things that develop fine, hearty, healthy shoates that later become pork makers and add to the farmers income.

A Creep Of Their Own

A trough and feeding ground may easily be given the little fellows by making an opening in the main pen large enough to enable them to pass through in a comfortable manner. In the trough provided, they may be given for their first feeds a little warm skim milk adding some middlings to it or other materials, such as ground oats, corn, etc., and they will eat it all up readily once they form the habit. Be careful not to overfeed. That is a worse habit than to practice underfeeding. Give them just what they will clean up readily. More middlings may be added as the pigs grow older. Next they will begin to eat a little cracked corn or corn that has been soaked together with other grains and the first thing we know, they are consuming quite a quantity of feed, thriving of course, growing frame and bone-developing properly into what they should be. As they grow older they will learn to rely more and more on the grain we feed them and finally the weaning task comes to an end and the mother is left in a good healthy condition and becomes strong again. By the time the pigs are eight weeks old, sometimes sooner, the pigs will have weaned themselves.

Milk Is Good For Pigs

There are many commercial pig feeds on the market. All of them are good that I have ever used. They must be good because there is competition and besides, they are scientifically prepared, calculated to assist bringing the pigs through the weaning period in first-class shape. These feeds are usually fed the same as those we prepare from the materials we happen to have at hand on the farm. Skim milk should form the basis for all these preparations where possible and fed in the form of a gruel while the little fellows are quite young. Nothing does the little fellows more good than to give them a warm sleeping place and enough feed to satisfy their appetites.—H. W. Swope, Pennsylvania.

How To Increase Concrete Strength

THE strongest concrete will be obtained by the least possible amount of water in the mixing to produce a plastic mortar or mix, but after the concrete is placed the concrete should be kept wet for at least ten days, if great strength of wear or strain is needed as in highways.

By keeping concrete damp for the first ten days adds 75 per cent to its compressive strength, and adds 65 per cent, to its resistance to wear. Three weeks of constant moisture will add still greater strength and resistance. Constant sprinkling may not be possible. Cover the concrete deeply with dirt, sand, hay or anything that will hold moisture and it will serve the purpose desired.—Elmer Whittaker.

Paint Without Oil

Remarkable Discovery That Cuts
Down the Cost of Paint Seventy-
Five Per Cent.

A Free Trial Package Is Mailed to
Everyone Who Writes

A. L. Rice, a prominent manufacturer of Adams, N. Y., discovered a process of making a new kind of paint without the use of oil. He named it Powderpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to A. L. Rice, Inc., Manufacturers, 134 North St., Adams, N. Y., and a trial package will be mailed to you, also color card and full information showing you how you can save a good many dollars. Write today.

We Raise Early Chicks for Early Broilers and High Prices

By A FARM WOMAN

SELLING broilers that weigh between two and three pounds the early part of June, for sixty cents a pound is more profitable than selling six months old cockerels at thirty-five cents a pound, even though the cockerels weigh twice as much as the broilers. But those early broilers mean early chicks and early chicks require lots of care. Chicks hatched the first week in March require very close attention the first month especially, on account of the cold weather.

I use a 240 egg size incubator and plan to set it the second week in February. As a rule, few if any, hens are broody at this date, and I have found that the incubator represents at least equal economy of time and labor compared to the setting hens. Of course, some folks don't fancy the care of an incubator, so they depend on good baby chicks. The fuel it takes to run the incubator costs less than the feed it would take to keep a sufficient number of hens to cover 240 eggs.

A Handy Way to Turn Eggs

Of course, the thing of first importance is to have eggs, the fertility of which one can be reasonably sure of and that are known to have been gathered before becoming chilled.

The eggs should not be over two weeks old, the fresher the better, and ought to be turned daily while waiting to be put in the incubator.

A handy method of turning eggs is to use a regulation egg case (12 dozen) with cover firmly fastened. This can be turned first on one side and then the other. Turning each egg by hand is a waste of time and energy.

Thorough study of the instructions which come with incubators will enable any adult to operate one. The eggs should be tested after they have been in the machine a week, and again about the fourteenth day. After testing the first time I boil the infertile eggs ten minutes and set them aside for feeding the young chicks. I consider an 80% hatch very satisfactory.

Avoid Too Much Heat

My experience has proved to me that it is safer for the hatch when the thermometer registers between 90 and 100 degrees for a few hours than it is for it to go much above 103 degrees. The lower temperature retards the growth of the embryo chick, but the higher temperature weakens it and will very soon kill the germ. However, the safest way is to watch the machine closely until it holds an even temperature of 103 degrees, except after cooling.

If the temperature has been kept at 103 degrees, except for an hour or so immediately following the cooling of the eggs, some eggs will be pipped the nineteenth day.

By the morning of the twenty-first day all chicks should be hatched. However, do not entirely despair if it takes a little longer for the chicks to arrive.

(Continued on Page 254)

How to cut down mortality of Baby Chicks

and build up greater vitality and disease-resistance

Following last month's announcement of the startling results secured in increasing fertility and hatchability by feeding the breeders Fleischmann's Pure Dry Yeast, Professor Harry R. Lewis now makes another announcement of equal interest and benefit to all poultrymen. It is on the results he secured in cutting down the mortality of baby chicks.

Professor Lewis, formerly Professor of Poultry Husbandry, New Jersey Agricultural Experiment Stations, is one of the best known authorities in the country and a successful commercial poultryman as well. He is interested both in the scientific and in the "dollars and cents" solution of vital poultry problems.

WHEN careful tests made with Fleischmann's Pure Dry Yeast for increasing fertility and hatchability showed an increased hatch of 25.2 per cent under most unfavorable conditions, Professor Lewis was completely convinced of the benefits to be gained from feeding Dry Yeast to his breeding stock.

In all, 19 of the 148 chicks from non-yeast-fed breeders died during the first three weeks—a mortality of 12.8 per cent. But only 22 of the 408 chicks from Yeast-fed breeders died during the same period—a mortality of only 5.4 per cent—*less than half the mortality rate of the others!*

The benefits from feeding Dry Yeast to breeders are not only transmitted to baby chicks through the eggs, but the yeast may be fed to chicks as soon as they start eating, being added to the regular scratch, or dissolved in water or milk.

Dry Yeast not only contains Vitamin-B, the vitamin of growth, in its most concentrated form, but promotes better assimilation of food and has laxative qualities of definite value in building vitality and disease-resistance in baby chicks.

A complete report on the tests carried out by Professor Lewis at his farm, Davisville, R. I., has been prepared. Send for a copy—it's free.

Fleischmann's Pure Dry Yeast comes in 1 lb. and 2½ lb. packages, 25 lb. kegs, and 100 lb. barrels. Full directions in every package. Your dealer should be able to supply you. If not, order direct from us, enclosing check, cash or money order with coupon below. The Fleischmann Company, 69 Bank Street, New York, N. Y.

Mortality Cut in Half

Then he determined to carry these tests even further, to see what the effect of feeding Fleischmann's Dry Yeast to breeders would be on the vitality and disease-resistance of the baby chicks hatched—and on the rate of mortality.

The result of these tests for cutting down mortality was startling.

A total of 556 chicks were placed in brooders. 408 of these were hatched from eggs from Yeast-fed breeders while the remaining 148 were hatched from eggs from breeders that *had not* been fed Yeast. The chicks were handled and fed exactly the same.

GRANGERS TRIPLE PURPOSE GRIT

WILL MAKE YOUR HENS LAY MORE EGGS

It is sharp and clean, and absolutely the best substance that can be procured for grinding the chicken's food in the gizzard, and thus aiding digestion, and it is so white that there is no waste, as the chicken finds and gets it all.

NO NEED FOR OYSTER SHELLS

GRANGERS TRIPLE PURPOSE GRIT is superior as a shell-maker. It produces uniformly hard shells that will not break easily, and does away with any need of oyster-shell, magnesium, or any other such materials fed for shell-making.

BALANCES THE RATION—INSURES DIGESTION

GRANGERS TRIPLE PURPOSE GRIT has a definite mineral content of Sulphur, Carbohydrates, etc., which gives the proper balance to the food required by both chicks and adult birds to keep them in good health, and enable the chickens to produce the best eggs and more of them.

League Withdrawals Light—Notes by M. C. Burritt

TOTAL cancellations from active poolers up to and including February 24, the latest report available as we go to press, Number 770. This number is much smaller than was recorded on the corresponding date of last year. It indicates that poolers are showing wisdom in standing by their organization.

Western New York Notes

M. C. BURRITT

IN the first lull of old winter which mid-February has given us, a lot of pruning has been done. Some growers are almost through pruning. A few are drawing brush and the man who has done none has missed an unusual opportunity. The ground was covered with a good crust of snow, thus keeping the pruner out of the mud and the air was balmy almost like spring at midday and yet crisp at night.

I like to prune trees. In his "The Apple Tree," Bailey tells why: "In the care of the fruit tree there is no practice which brings the grower into such intimate knowledge of the plant as that of pruning and thinning. The operator sees the tree as a whole, taking it all in; then he sees it in small detail in all its parts, even to the spurs and buds. With simple good tools, sharp and keen, and with a practiced eye, he applies a deft and swift hand-craft, cutting true, making a fair, clean wound leaving the tree comely and ready for its highest effort. The pride of good workmanship may find expression. The operator feels also the sense of mastery that is in him whereby he corrects the tree, removes the wayward parts, keeps and encourages all that is best. To engage in this kind of education requires that one approaches the work with due preparation of mind and I think also with consecration of heart."

* * *

Most of us prune mature apple trees without having any definite principles or even ideals for the tree in mind. And yet the experienced grower makes but few mistakes. In the main he allows the tree to assume the natural form for the variety, thinning out the branches to let in the light, removing crossing or rubbing branches, suckers, dead wood, etc., and preventing bad crotches that are likely to split down. Of course many growers have systems of their own most of which are modifications of this general plan, plus heading back, or with central leaders. Many would find it very profitable to read Cornell Bulletin 415 by Dr. W. H. Chandler, "Results of Some Experiments in Pruning Fruit Trees." Professor Chandler has probably lived and worked with fruit trees more than most of us and knows his trees intimately. He is a scientist and a close observer with an unusually practical turn of

mind for a scientist.

One thing that is constantly in my mind, as I prune is, where the fruit buds are and the fruit is therefore likely to be borne, if at all. Then will there likely be too many on this branch, and should I remove some of the probable competition. And finally can I get at it to spray it thoroughly and thus make it perfect fruit; for only a high percentage of A grade fruit can make the crop a profitable one if one is going to care for the tree in other ways.

Farm Prices Suffer Slump

Farm markets have experienced the general slump. Wheat is off about twenty cents from the high point. The cabbage market is slow and draggy. One shipper has had to sell as low as ten dollars a ton. The apple market has felt the effects of the warmer weather. Prices have been pretty well maintained but the movement to market is much slower. Cattle especially high-grade or pure-bred tuberculin tested ones are rather scarce and high. One cannot buy much of a cow for less than one hundred to one hundred and twenty-five dollars. Egg prices are beginning to fluctuate widely mostly downward—a sign of spring.

The weather has been so mild for nearly two weeks now that the snow is pretty well gone except where there were drifts. This leaves wheat bare where it is not covered with ice and is likely to mean considerable injury to this crop. —M. C. Burritt.

Lewis County Notes

Farmers who are fortunate enough to possess a woodlot are busily engaged these days in getting out a season's supply of fuel. If they are lucky enough to have a few surplus cords, they can find a ready market for it locally at from \$4.50 to \$5 per cord. Owing to the unusual high price of coal which has reached \$15 per ton for some grades, it has created an unusual demand for stovewood, one man having contracted for a large amount and is shipping it to Rochester in carload lots.

Large quantities of hay are being pressed in different sections of the county, one gang of pressers having just finished pressing 175 tons for one farmer. Not very much being moved owing to market conditions.

Owing to the long protracted drought that continued all through the autumn until nearly Thanksgiving time, not very much plowing was accomplished, many farmers have scarcely turned a furrow, which will mean busy times next spring.

Considerable reforestation is being done on the east side of the Black River. One farmer has ordered 30,000 spruce seedlings through the State Conservation Commission and will be distributed from the State Nursery farm located east of and near Lowville.—CHARLES L. STILES.

THE DANGER POINTS

Reviewing the Latest Eastern Markets and Prices

MILK PRICES

THE Dairymen's League Cooperative Association announces the following prices that dealers will pay the League during the month of March for milk testing 3% in the basic zone of 201 to 210 miles from New York City. *It is to be understood, of course, that the prices mentioned below are not received by the farmer, but go into the pool. They represent the prices dealers pay to the League.*

Class 1 Fluid milk	\$3.07
Class 2A Fluid Cream	2.20
Class 2B Ice cream	2.25
Class 2C Soft cheese	2.15
Class 3A Evaporated whole milk	
Cond. whole milk	1.90
Class 3B Whole milk powder	1.85
Class 3C Hard cheese other than American	1.65

Class 4 prices will be based on butter and American cheese quotations on the New York market.

Sheffield Producers

The Sheffield Farms Producers announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$3.07
Class 2	2.20
Class 3	1.75

Class 4 prices determined by butter and cheese quotations on the New York market.

Non Pool Cooperative

The Non-Pooling Dairymen's Cooperative announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$2.80
Class 2	2.20
Class 3A	1.80
Class 3B	1.75

Interstate Producers

The New York State Milk Producers Association (Philadelphia Price Plan), announce the receiving station prices or the price to the farmer in the 201 to 210-mile zone from Philadelphia for 3% milk is \$2.19. In the 101 to 110 mile-zone, the price is \$2.29.

BUTTER HOLDING ITS OWN

The butter market is holding its own. One of the encouraging features is the substantial reduction in storage holdings as well as satisfactory clearance of street stocks. Consumption has been comparatively good. Opinions of men in the trade are quite unanimous that there is nothing in view at present that can be held responsible for any material change in the situation or line of values. Receivers, however, are reluctant to hold goods. They are selling freely to keep stocks moving. It cannot be said that the butter market is strong. It would be folly in view of the statistical situation. Receivers are willing sellers on each day's market which has resulted in holding down street stocks to a lower point and made possible an appreciable reduction of storage holdings. Had this procedure not been followed during the past few weeks, there is no question but what the butter market would be utterly demoralized. There seems to be a greater feeling of optimism than was true three or four weeks ago. Creameries scoring higher than 92 are bringing as much as 42c and selling quite freely at 41½c, while 41c represents the general trading price for 92 score butter. Below 92 score prices range from 34c for low grades to 40½ for 91 score.

EGG DECLINE FURTHER

The egg market has declined at the rate of a cent a day since our last report, 41c now representing the fanciest nearby closely selected whites. The main reason for this is that receipts are increasing continually. Advices indicate that shipments are on the increase. In a downward market of this kind it is very hard to interpret or define values clearly. What may represent one line of goods in the morning may be altogether different in the afternoon. Pacific Coast whites have had much to do with the decline in the market. Receipts from the Coast have been heavy and naturally full supplies of high grade goods of this kind will have a depressing effect on anything that comes into close competition.

Brown eggs have been holding up comparatively better than whites, although final depression on the market was so marked that colored receipts also suffered a slump. Nearby hennery whites are worth all the way from 35c to 41c depending on quality, interior and exterior, as well as size, shape, etc. Gathered whites are worth anywhere from 33c to 37½c while pullets are bringing from 33c to 34c. Fancy nearby brown eggs are bringing from 36c to 38c.

We repeat our recommendation of the last two or three weeks that producers compare their local market with the New York Market. We know of several instances where country markets are above New York City quotations.

POULTRY SITUATION BETTER

The live poultry situation is a little better than it was a week ago, especially on fancy fowls. Receipts have not been over heavy. As a matter of fact on the 25th there was hardly enough live poultry available to go around, which naturally caused a hardening of prices. If receipts stay about the same as they are, there is no reason why the poultry market should

not hold up. Where fowls are strictly fancy, they are worth 34c, a cent above last week, whereas average fowls are worth 33c. Even Leghorns which are usually 2 or 3 cents below the fancy colored fowl market are worth the same as the average run.

Fancy chickens, colored and smooth legged are worth from 35 to 38c, but very few of this class are being received. A lot of chickens arriving are quite staggy. Average run goods are worth around 30c.

NO CHANGE IN POTATOES

There is no change in the potato market since our last report. The entire trade throughout seems to be quiet, especially at the piers. The 33rd street yards reported trading in fair proportions and values have been ruling fairly steady. Even Long Island's have been having slow movement. Maines in bulk are bringing anywhere \$1.10 to 1.25 per cwt. A few sales have been reported slightly above the top mark but these do not represent the average market, while Maines in 150 pound sacks are worth from \$21.0 to 2.40. The wide range of prices is indicative of the fact that quality is variable. States in 150 pound

sacks are worth anywhere from \$1.65 to 1.90 although some fancy shipments are said to have been bringing a little better than the outside figure.

BEAN MARKET DULL

There is no change in the bean market since last week. Pea beans are still held at \$7.25 for fanciest marks while common grades are turning as low as \$6.75. There is not a whole lot of trading going on. Red and white kidneys are hitting a rather slow market, although values are unchanged from last week. Red kidneys are bringing \$10.25 to 10.75 depending on quality. White kidneys are also the same, varying from \$8.75 to 9.50. Marrows are worth \$9 for common stock and graduate upward to \$10.25 for choice marks.

HAY MARKET WEAK

Liberal arrivals have prevented any improvement in the hay market and as a result conditions are about the same as they were about a week ago, \$27 representing the top of the market for timothy in large bales. Other values are practically the same as they were last week.

New Jersey Farm News

Farm Legislation Well Under Way

AGRICULTURAL legislation now pending in the New Jersey Legislature is reviewed in a statement by the New Jersey Federation of County Boards of Agriculture sent this week to its membership throughout the state. The report shows that several farm bills had been well advanced in the Legislature by late February and that a number of other measures now in Committee were receiving strong backing from the State Farm bureau and the New Jersey State Grange, a combined membership of over 20,000 farmers in New Jersey.

Excerpts from the review, signed by Dr. W. H. Whiton, Chairman of the Joint Legislative Committee, representing both organizations, follows:

Insurance Bill Passes Senate

"Among the measures in which farmers are vitally interested is one which would authorize agriculturists to form mutual insurance companies to handle their own risks. This measure passed the Senate without amendment and promises to be brought out of Committee in the Assembly shortly. A bill amending and supplementing the present milk dealers' licensing and bonding act so as to require a license and provide for enforcement of the measure, has passed the Senate and is now in the Assembly. Live stock men throughout the state have been intensely interested in an Assembly bill which increases the penalty upon the owner of a roving bull to \$100. This bill has passed the Assembly and is making progress in the Senate.

"One of the measures of general interest to all farmers is a Senate trespass bill, which would protect owners of cultivated land against trespassers in substantially the same way that the hunting laws now give protection against wilful trespass on posted property. The measure is making progress and should be acted upon further by the early part of next month.

Ask Repeal of Dog Law

"Under the present statutes, owners of dogs are liable to a fine of \$20 when their dogs run at large even upon their own property. This restriction has worked a serious hardship and the farmers have asked for its repeal. A bill to this effect is now in Assembly Committee.

"The Senate now has under consideration a series of companion measures which would enable the Department of Agriculture to deal with the recent poultry plague in New Jersey. An Assembly bill would authorize \$3500 to finance this work. The measures are progressing satisfactorily. Southern New Jersey farmers have sponsored an Assembly measure which would provide a method for validating claims for damage by deer, under proper precaution against fraud, and permitting voluntary payment by the counties where damage occurs.

Short Course Students Graduate

THE New Jersey State College of Agriculture at New Brunswick graduated with appropriate exercises on February 19th some sixty students from its short courses in agriculture. These courses covered general farming and dairying, poultry husbandry, and fruit growing. Certificates were given to those students in each course who successfully completed the prescribed course of study.

Practically all of these students, some of whom were mature men, will return to New Jersey farms to put into practical everyday use what they have learned in their twelve weeks of intensive work at the State College. No other work done by the State Colleges of Agriculture is of more benefit to the general farm business and to farm communities than are the short courses of

instruction. They enable men and boys to get away from the farm during the dull period of winter to acquire the most up-to-date and practical knowledge of their business and return with this better training in time to make the plans and open the work of the new season.

The New Jersey State College, its Dean and Director, Jacob G. Lipman, its Director of Short Course work, F. G. Helyar, and all of its teachers, are to be highly congratulated upon the work they are doing in these short courses in returning men to the farms with practical training and a wider outlook upon the great business of agriculture.

Observations of a Census Enumerator

Because the writer has been a county crop reporter for many years, he was asked to take the census of the farms of his township.

Few Farmers Keep Books

One of the most noticeable facts learned was that very few farmers keep books, or know fully about the receipts and expenditures of their farms, so as to be able to tell what they received for the sale of eggs or dozens, or of pounds of milk sold, except where they kept the stubs of milk checks or the 13th check from the Dairymen's League. Very few could tell what they paid out for labor, feed, fertilizer or repairs. Nearly all could tell the amount paid for tax by referring to the collector's receipts. All agreed that local taxes are too high. Only a few were unwilling to tell the amount of debts owed. The writer was pleased to learn that not so many farmers are in debt as one might expect after the three past years which were lean ones for farmers.

Several of the surprises were the very few colts or young horses on farms, and how few young boys and girls over 16 there are on farms. Another surprise which follows naturally the last one, is how few farmers make their own butter for family use, due to lack of help in the house.

Great Lack of Sheep

One sheep was found in the township only, where hundreds were kept within the writer's memory. Only three farmers are feeding steers this winter where many are fed some years. But the very poor corn crop reported on farms having low fields in corn last year, tells why not more steers and hogs are being fed, as some farmers on good farms must buy corn to feed their stock until fall.

The variation in the number of dozens of eggs laid by 100 hens was so different on farms that one wonders, if it is due to feed or breeds. Very few turkeys are kept or raised on farms where large flocks used to be raised. They seem harder to grow than years ago. Generally, the writer was treated with proper respect, and questions were answered freely and fully as they could be without account books being kept, though one often had to add the weight of milk sold from month to month to the dozens of eggs by months.

On the whole, it was a new and pleasant experience to get into all the homes of the township, to meet old friends and make new ones, to prescribe for the sick persons and horses, as the writer did in several cases help children with school problems and visit schools, all of which were done over muddy roads, rough roads and some good picked ones. Several farms are for sale for less than the good buildings on them are worth.—J. N. Glover, Pennsylvania.

Shall Boys Drive Cars?

Albany Hearing on Farm Bills Draws Crowds

RURAL interests were largely represented at a hearing in the state Capitol here today before a joint meeting of the Senate General Laws and Assembly Motor Vehicle Committees on all bills now pending before the State Legislature affecting motor vehicles and motorists.

By T. C. STOWELL

Indeed, it was measures affecting the rural interests particularly that attracted the largest numbers and greatest attention, such as the proposal to reduce the age limit at which an operator's license may be issued, provision for snow removal from country highways and the contemplated tax on gasoline, especially in relation to the possibility of its raising revenue to assist in snow removal.

Motor Operator's License Proposed

A bill which affects residents of the rural section about as much as any, so far as its direct results are concerned is that of Assemblyman Kenneth H. Fake, Republican, of Cobleskill, Schoharie county, to make 16 the minimum age at which an operator's license may be issued, instead of 18, as the present law provides. Mr. Fake's bill would establish a junior operator's license for minors 16 to 18 years of age, would permit the holders of such licenses to operate motor vehicles between the hours of sunrise and sunset in going to and from school or in the ordinary business of their parents, the application for a license to carry the parents approval. The holder of a junior license could not operate in a first class city.

Discussion For and Against Lower Age Limit

The State Federation of Labor went on record in favor of the proposal, as well as some automobile clubs. The New York State Automobile Association placed itself on record against the bill. Its representative, Oscar J. Brown of Syracuse, said that the association opposed all bills seeking to lower the age limit for operators' licenses.

"For fourteen years," he said, "it has been the principle of the State that no one under 18 years of age should drive an automobile. This committee would do more for the good of the state by considering raising the limit rather than lowering it."

E. A. Moree, representing the Empire State Automobile Merchant's Association, took issue with Mr. Brown. He declared it is more a question of fitness rather than of age, whether a person should be permitted to drive a car. Indeed, he said, it is probably a much greater safeguard to permit children gradually to become accustomed to a car and to be trained into driving than suddenly to give them the authority.

"Children used to be born with silver spoons in their mouths," he said. "Now they are born with automobiles in their mouths."

Lower Age Limit an Aid to Farmers

Assemblyman Fake explained the provisions of his bill and told how it would assist farmers in doing their work. "It is ridiculous," he said, "that a farmer's boy or girl, 16 or 17 years of age, who shares the duties of farm life with his parents should not be permitted to drive legally in the country to assist in carrying out these duties." He said he would amend his bill to strike out the "sunrise to sunset" provision.

Snow Removal a Big Issue

Another question that brought keen discussion was that of snow removal, two or three proposals being before the committee providing various means of financing such activity.

"The importance of keeping the roads open during the winter has become increasingly evident," declared Mr. Moree. "When you groundhog the automobile these days, you groundhog business."

James J. Dadd of Rochester, Secretary

of the autobus association of the

State argued that the state has an obligation to keep the country roads open in the winter for the automobile omnibuses in view of the large license fees they pay.

"If the state," he said, "is going to charge bus owners a big license plate fee to travel over the highways all year round, the state should either make it possible to travel on the roads all year, or refund a portion of the fee for the time the bus owners can not use the highways."

Two Gas Tax Proposals Considered

Two proposals for a gasoline tax were considered. One, introduced by Assemblyman Milan E. Goodrich, Republican, of Westchester, would impose a tax of two cents a gallon on all gasoline sales, to be collected at the source. The present registration fee graduated according to weight of cars, would be changed to provide for a flat fee of \$3 for each pleasure vehicle, and a greatly reduced graduated fee for commercial vehicles.

The other bill, introduced by Assemblyman Bert Lord, Republican, of Chenango, former head of the state motor vehicle bureau, would fix the gas tax at one cent a gallon and retain the present registration fees.

Gas Tax Generally Approved

Virtually all of the interests represented expressed approval of the principle of a gasoline tax. Some, however, favored the Goodrich bill, while others favored the Lord bill. The State Automobile Association did not go on record as favoring either bill, but did oppose the Lord measure.

Harry B. Crowley, representing the Automobile Club of Rochester, declared that a gasoline tax is bound to come, sooner or later. "We can't get away from the principle," he said. "It is a pay-as-you-go policy, and it is right." He caused something of a surprise in the committee by declaring that he understood a gas tax bill would not pass the present session, and therefore advocating a committee to study the whole question.

Some Amendments Proposed

Assemblyman Goodrich indicated that he might amend his bill to provide a registration fee of \$3 for cars weighing up to 2,500; \$5 for cars from 2,500 to 3,500; and \$7 for cars weighing more than 3,500 pounds.

Mr. Dadd approved both bills, provided two amendments could be made. One would provide for a cut of 50 per cent in the registration fees proposed in the Goodrich bill for omnibuses. The fees are already cut about 50 per cent from the fees in the existing law. The other amendment would increase the proportion of the funds collected from the bills which would be used for snow removal on main traveled highways.

Large Farm Delegation Present

A large rural delegation appeared in behalf of Assemblyman Lord's bill, including among others: From Cattaraugus County—J. W. Watson; from Chenango County, W. G. McHugh, Clark A. Tinker, Clive Swan, George Adams; from Otsego County, William Dickson, Frank Taber, County Highway Superintendent V. L. Hoke, County Attorney D. J. Kilkeny; from Oswego County, N. Ackerman, Henry Bradford, Wesley Manwarien, County Highway Superintendent A. A. Howard; from Lewis County, County Highway Superintendent L. P. M. Gaylord, Fred Grubel; from Washington County, Highway Superintendent F. W. Harris.

We pay for the farm machinery which we need if we do without it; it pays for itself if we buy it.—Selected

WOLVERINE

The 1000 Mile Shoe

Walker Brothers
General Merchandise

Rt. 4, Ripley, Miss., 3-19-'24
Wolverine Hide & Tanning Corp.
Rockford, Mich.

Gentlemen:

We would like to have your catalogue of your Wolverine 1,000 mile Plow Shoes. We have been wearing your Wolverine Work Shoes for three winters and those shoes are good yet. I have had soles put on them but the uppers are still good. The leather is as soft as a glove.

Yours truly,

Walker Brothers

The
"All-Work"
Shoe
cut a little
higher especially to keep
out plow dirt

Try this
Horsehide Shoe
1000 Miles Wear
always dries out soft
It's our secret tanning process

Men are amazed by the wear they get from Wolverine Cordovan horsehide shoes. We receive thousands of letters like the one above. There's a real reason for this remarkable wear. It's the tannage. Cordovan Horsehide is by far the toughest wearing leather known to man. Big league baseballs are covered with horsehide. For no other leather has been found to stand the terrific pounding. Cossack saddles are made of it. And the finest Army Officers' boots are made from the thin "shell" layer of horsehide.

But never before could horsehide be satisfactorily used in work shoes. For it always tanned up too stiff. After years of experiment, however, we found a way to make this tough leather soft as oiled rawhide. It's a secret process developed in our own tanneries. It not only makes the leather soft. It keeps it soft. Even after many wettings Wolverine Cordovan horsehide shoes dry out soft as velvet.

You'll never know how good these shoes are till you try them. Take the thick pliable leather be-

tween your fingers. Soft as velvet. Tough as rawhide. Easy on the tenderest foot. Their long wearing qualities will surprise you, no matter how hard you may be on shoes.

We are work shoe specialists. We make no other shoes. We select the choicest hides, and we tan them ourselves. That's why you'll find Wolverines different from any other work shoes.

For farm, shop, lumber camp, oil field or mines and for every season there is a Wolverine shoe exactly suited

to your needs. Try it. You'll say there never was such a shoe for wear. And for comfort, too!

If your shoe dealer cannot supply you, please write us. We'll send you a catalog and the name of the nearest Wolverine dealer.

J. N. NACE, RICHFIELD, PA., BOX 161

Early Chicks for Early Brooders

Continued from page 249

I have had fairly successful chicks hatch the twenty-third day.

It is not wise to feed until the hatch has been out thirty-six hours. At the end of the thirty-six hours I give each chick a drink from a pint of water in which one teaspoon of baking soda has been dissolved. An elderly and experienced chicken raiser told me of this and I agree, with her, that it is at least a partial preventive against digestive troubles. I know of others who put lime in the first drinking water.

After the chicks are back in their pens I feed sparingly of the chopped hard boiled eggs—that were tested out of the incubator. They receive no other feed than the boiled eggs for the first four days. After this I feed rolled oats and the best grade of commercial chick feed, plus scraps of bread or vegetables from the table, until the chicks are two weeks old. Finely chopped green vegetables should be fed occasionally, if the weather is such that the chicks cannot have access to grass. About the third week, cracked corn and wheat is added to their food.

Do Not Let Chicks Get Wet

The chicks should have access to plenty of clean drinking water, but it is imperative that special "chick waterers" be used, or if shallow pans are used that they be filled with small pebbles. The chicks can reach between pebbles with their bills, but their feet must be on pebbles that are not covered by the water. In my first "inexperience" I lost quite a number that were crowded into the drinking vessel enough so as to become wet and weak. The others soon trampled them to death. And a number of tiny chicks toppled over on their sides from an easily preventable cause is a disheartening sight to the ambitious chicken raiser.

Look Out for Rats

Unless your brooder house is "rat proof" rats will destroy many chicks in one night, if they can find a way to enter the sleeping place of the chicks. They have also stolen my "henless" chicks in broad daylight.

Putting rat poison out has disadvantages as great as its advantages—on the average farm. So often the rats will drag a piece of the poisoned bait to a place where older fowls or stock may get it.

We have found the persistent use of temptingly baited traps and good cats the safest exterminators of rats.

Beginning the first night that the chicks are placed in the brooder house, we set several rat traps. Of course, care must be taken to "spring" the empty traps before any chicks are let loose each morning.

A rat proof brooder house is the best investment, if one can afford it.

Keep Mash Before Them

When the chicks are a month old, dry mash can be kept before them all the time. In preparing this I like to mix enough to last several months. The following mixture has proved good: 100 pounds corn meal, 100 pounds middlings, 50 pounds ground or rolled oats, 100 pounds wheat bran and 50 pounds of meat scrap.

We empty the ashes from the furnace and the wood range where the chicks may dust themselves and pick up the bits of charcoal.

Mountain Lred Full Blooded AMERICAN CHICKS

Noted for health and vigor because they're produced and bred in the healthful mountain-top climate. From strains that are famous for egg production. All varieties. We specialize in the famous Hollywood S. C. White Leghorn strain which has been returned winner in egg-laying contests from Maine to California. Big discounts given on lots of 500 to 1000. DAY-OLD CHICKS From 4,000 matured hens. Bred for utility, and size. MARVEL POULTRY FARM, Georgetown, Del.

When writing to advertisers be sure to mention the American Agriculturist.

Sour milk or curd is an excellent feed and takes the place of meat scrap. One year our cheese factory made butter for a time and the patrons received the skim milk free. I heated this sour milk in wash tubs and removed the curd. This curd made splendid feed and the chicks were ravenous for it. They got so they would not eat but little of their cracked corn and wheat and lived on curd almost entirely — but after two weeks of curd diet, I found a number of dead chicks in the sleeping boxes one morning, and noticed that the whole flock looked sick. On picking up several I found their skins to be bloated. I pricked several of these gas bubbles and this seemed to relieve the chick. I withheld the curd for five days and most of the flock recovered. After this I fed less of the curd.

Diarrhoea Takes Its Toll

White diarrhoea destroyed many of my chicks the first year I tried the poultry game. As soon as I notice any of my chicks looking droopy-winged and sleepy now, I remove them to a "hospital box." I treat the remainder of the flock by withholding feed for four hours, then seeing that the chicks drink freely of water in which one teaspoon of Epsom salts has been dissolved to a pint. Keep this drink where they can get all they will take, for one day. The flock will seem "dumpy" for a day after this, but keep them warm and dry and quiet feeding just as little as will keep them alive. It usually takes four days for the disease to run through a flock. This method has proven the best for me, but I do not guarantee it to be always effective.

Even under the best of feeding conditions and diet, cannibalism often develops in a large flock of confined chicks. The only way I combat it, is to remove from the others any chicks who have the tiniest particle of blood showing.

Get Chicks Outdoors

As soon as the weather permits, chicks should be in direct contact with the earth. A pen made of old boards a foot high, the size of a discarded screen door which can be used to cover it and keep out older fowls, is useful as it can be easily moved to fresh grass plots.

Even when they are large enough to have "chicken sense" incubator chicks need to be shut in when it rains as they will not protect themselves as "hen raised" chicks will.

Hawks often destroy the chicks after they are large enough to roam. The best remedy is a shotgun in the hands of a good marksman.

Ten days before my broilers are due to be dressed, I place them in a portable pen and feed all the soaked corn they will clean up. The corn should be soaked at least forty-eight hours, and should be fed often but in small amounts. The pen should be moved so that the supply of clean grass is never low, and plenty of clean water should be where the broilers can help themselves.

Be sure of your market before beginning to fatten.

My favorite breed is the Rhode Island Red, but I believe any of the heavier breeds produce good broilers.—Mrs. J. E. Baltzell, New York.

Keep the Good Mothers

THERE are a great many farmer's wives who still prefer the mother hen for rearing the chicks. There are good mothers and bad ones, and if you

are depending on hens better pick out the good mothers and keep them. Mothers that continually fight other hens are only a trifle worse than the mother that will let all the chickens on the place eat with her flock. The ideal mother will defend the food from old fowls and from large chickens, but is not on the war path for small chicks or for any that stay in their place. I have had such and we kept them and one old hen reared four flocks one summer, staying with a flock hatched the eighth of September until they were almost as large as she was, and she didn't lose one until they were large enough to fry. Old No. 12 was kept busy rearing families for five or six years.—Rachel Rae.

Running the Incubator

THE modern incubator is a good investment. Each machine has its certain characteristics and if the manufacturer's directions are followed there should be no difficulty.

A good incubator does not require a "special room". Common sense is needed in locating it so that sudden changes in temperature will not throw it out of adjustment. The best location is a well ventilated room with a fairly steady temperature of around 60 or 65 degrees.

Run the incubator for few days before you put the eggs in it. Bring the heat up slowly and spend plenty of time making the final adjustment at the proper temperature.

Test the thermometer carefully if you are using it for the second season. This can be done by using a regular physician's thermometer.

Be sure you do not stand the incubator where the sun's rays can hit it.

Manufacturer's directions will take care of the moisture problem. This does not mean, however, that it can be operated in a damp cellar.

If you operate your incubator in the house or any of the farm buildings, be sure you get a permit from your insurance company. It will not cost much and it is a good precaution.

Make sure the room is well ventilated but not drafty.

More About the Hens and the Eclipse

AS a child I had heard my father tell of a total eclipse of the sun as related by his parents, and the incident of the hens going to roost particularly impressed me so I had it in mind to see with my own eyes how they would behave during the recent eclipse.

Talking about it with two neighbors who each have good sized flocks we fell to wondering what they would do if lighted so the two of us who light our hens from sunset until about 8 o'clock agreed to take the gasoline lanterns to the hen house as soon as the eclipse became visible and leave them until it was over and then compare notes with No. 3 who does not use lights.

According to the agreement the man of the house lighted the hen house at the beginning of the eclipse but had to be away from home that time until about 10:30 a. m. and I became so complete absorbed in watching the sky that I forgot all about watching the hens.

There were some light clouds that added much to the effect but in no way interfered with Old Sol and a perfect view of his eclipse and with the strange wonderful beauty of the heavens and the weirdness of everything it was a never-to-be-forgotten sight. It would be interesting to observe another, in the

RELIABLE BABY CHICKS

Produced under Supervision of Men Trained by Poultry Department, Ohio State University

R. E. FADER

When the Poultry Department of Ohio State University agreed to train and authorize men as inspectors for the Accrediting of hatcheries which come up to their standard, Mr. R. E. Fader of Norwalk Chick Hatchery immediately put his flock under such supervision. He is hatching and selling nothing but Accredited chicks. Mr. Fader has been in the poultry business 22 years and has an unusual record for success in his line of work. His flocks are carefully bred and the chicks he produces are healthy and strong.

He is offering chicks from eight breeds at a fair price. The public can buy chicks from the Norwalk Chick Hatchery and feel sure that they will get honest and square treatment. Mr. Fader will send a fine illustrated catalog on request, if he is addressed at the

When writing to advertisers, be sure to mention the American Agriculturist

summertime, as without snow on the ground the darkness would naturally be deeper and the general effect different. Small wonder that the Ancients were panic stricken at the occurrence of such an unexpected phenomenon.

The Hens Are Forgotten

By the time the man of the house returned it was all over and how I did hate to own up that I hadn't thought of the hens until it was too late. The laugh was all on me as the others had closely observed theirs. The one who also lighted his hens took up his post of observation near so as to watch them without missing anything else and reported that fully one half of his flock of 250 went to roost on the roosts while the rest huddled on the floor. Now why should they have done so, with full light on before darkness began to fall when they never do at close of day. It is possible that they "sensed" something out of the ordinary in nature to go to roost like that in a brightly lighted house.

The other neighbor who does not light his hens, said the greater part, probably three-fourths of his flock of 200 went on to the roosts and the rest huddled on the floor. His family said that because of watching them he missed the best part of the eclipse.

I greatly regret forgetting to watch ours, but can say of our neighbors that "their word is their bond."

Reading Mr. Ohm's inquiry if any one watched their hens prompted me to reply as this may be of personal interest even through unsuitable for printing—as not being the account of an eye witness.—A Farmer's Wife.

Don't Let the Mites Kill the Setting Hen

THIS is done so many times. Only last summer I knew of two hens dying from mites sucking their life out while they were setting on eggs. One died the very day her eggs were to hatch and the eggs were lost, but the other hatched the chicks and was so light that they were taken from her and given to another hen. She died in a couple of days though. These hens were set in the henhouse shut away from the other hens. The owner did not know the henhouse was very badly infested and never dreamed his hens were suffering slow death. It is never really safe to set hens in the henhouse where hens roost nor to use the regular laying nests, for mites congregate on such hens. Remove in the daytime and set in fresh nests and you will have few mites in the new nest and no likelihood of their becoming troublesome while she sets.—Rachel Rae.

Cod Liver Oil for Chicks

I see a great deal about the use of cod liver oil. Is it the kind you buy in the drug store?

The drug store type of cod liver oil is usually an emulsion. This is NOT the kind to give your baby chicks. It is important to use only pure raw cod liver oil. Do not use the emulsion.

The Trouble Maker—By E. R. Eastman

CHAPTER XXIV

A while later, it might have been an hour or an eternity, Jim stood alone by the gate that led to the rural cemetery at North Speedtown. The funeral was over, his friends had come, had done what they could, and had gone.

He knew he must travel soon up across the fields and begin his chores, but he dreaded to go back. He did not see much purpose in doing the chores, or any of the other work for that matter, that stretched ahead during the long years. Grief and heart-sick discouragement sat heavily upon him.

Suddenly he felt like a little boy again, a little boy who had lost something that he loved. His shoulders began to heave, and, like a little boy, he threw himself flat on the grass and allowed the hot tears to come.

After a time he became calmer and rolled over and sat up. Across from him, squatted on his heels, and looking at him, was Dave Messenger, the sheriff.

"Kinda figgered I'd find you here," drawled the older man. "Always the hardest time is right after all the excitement of the funeral is over. Feller has to bear up when folks are around, but after they're gone, he can kinda let down and mebbe get some of it out of his system. Don't I know it. Been all through it, Jim, two or three times. Don't often talk much about it."

He stopped while his somber gaze wandered over the western hills.

"Somewhere over there, Jimmy," and he waved his hand, "I left a little boy quite a spell ago, and more recently my wife. . . She was a partner that I set quite some store by. . . and one that I trailed around with quite a spell.

"So I know how you're feelin'," he continued more cheerfully. "Don't seem now to you as if there was much to look forward to, but there will be. . . The sun will shine; the birds will sing; and the good old grass will grow green again. . . only it'll take a little time for you to see it."

Jim was grateful for the kindly voice. Strange how the little man just naturally understood.

"If it wasn't for sister, I'd go away, Dave," he said. "Seems as though I couldn't face the old round of work any more. Got too many memories."

"Memories have to be lived down, Jimmy, and I've found out you can't do it by runnin' away from them."

Jim looked out across the ancient stones of the old churchyard and then as his grief welled up again, he cried:

"Oh, Dave what's the use of it all, anyway? Look around here. This is where we all end up."

"There are worse places to end than this," said the other quietly.

But the boy did not hear, or paid no attention.

"When I was a kid," he continued, "I learned that piece of Gray's, 'The Elegy Written in a Country Churchyard'. Never thought of it much until lately, but the way I feel now, he had it about right. Ever read it? It went something like this:

"Each in his narrow cell forever laid, The rude forefathers of the hamlet sleep,

Oft did the harvest to their sickle yield, Their furrow oft the stubborn glebe has broke;

How jocund would they drive their team afield!

How bowed the woods beneath their sturdy stroke!"

"Yes, I've read it, but it's poor stuff for you to be thinkin' about now."

"Maybe it is," returned the boy, "but every word of it is true of the men and women that lie here. You're something of a stranger in this country, Dave, so maybe these old Yankee names don't

mean so much to you. But I know them so well that I can pretty nearly shut my eyes and call the roll of the Yankee farmers that are buried here: Royce, Brown, Ball, Manning, Taylor, Japhet, Rightmire, Leonard, Mead, Barrett, Jackson, Stone, Thompson, Miller, Lynch. They and their fathers came into this country not so many years ago with a 'hip, hip hoorah, boys', and like it says in the 'Elegy', the woods did bow beneath their sturdy strokes, and with many a loud joke they did drive their teams afield, and broke the stubborn glebe with their furrows. But where are they now, Dave? I ask you, where did it get 'em?"

He waved his hand over the quiet yard, and answered his own question:

"They're all here."

"Yes," agreed the other gravely. "they are all here. Their bodies are," he said simply, "but after all, they did live while they lived. They had troubles, but they also had their fun. Prob-

So the two men climbed the fence on the other side of the road, and went up across the brown October fields to Jim's home.

"Got some overalls that I can put on?" asked Dave.

When Jim protested that he could not let the sheriff work, Dave insisted.

"Knew a little about ranchin' myself once. Guess I ain't forgot it all. Seem good to get into the old duds again."

The only overalls that Jim could find were big enough for two sheriffs of Dave's size, but he put them on, and turned them up at the bottom. Then he and Jim went to the barn, drove in the cows, and set about the milking. As they milked, Dave, naturally given to long silences, kept up a steady stream of talk to help the boy, and he knew by the response which he got that at least a part of the time Jim was forgetting his troubles.

The cows were soon milked, and

the ranch. The blow killed my wife. We had worked a long while together gettin' a little ahead, and she was just too discouraged to start over again."

Dave stopped talking for a moment, then went on:

"It got into the newspapers somehow, so of course you've heard how I run up and down the earth till at last I put most of the gang where they ought to be. At the same time, I got a lot of others of the same kind where they won't be robbin' poor folks for quite a spell. Probably heard the story, haven't you?"

"Yes, Dave, I've heard it. You certainly had a lot of stick-to-it-iveness."

"I s'pose some folks wouldn't call it by so good a name. Probably they would say I am vindictive and revengeful. Maybe I am, but I like to think I've followed those human snakes for years, to put them and others of their kind where they couldn't ruin anybody else's lives."

"Your friends wouldn't say you were vindictive, Dave, but I must say, I'd be a little worried myself if I had been up to some deviltry to know you were on my trail."

"Finally landed in Speedtown," the sheriff went on. "I let it be known that my job was done and that I wanted to settle down for a little peace and quiet. But that wasn't quite all of the truth, boy. That trail that I started some six years ago is not quite ended yet. But at last I'm beginnin' to see the end, and it's right here in Speedtown. Yes, sir, the job is pretty near done, boy, and I'm glad. It was a long, hard trail, and I'm gettin' kind of tired."

In the dusk, Jim could see the little sheriff going through the motions of re-filling his pipe and lighting it. After a little while, he went on:

"Never told this to but one person before, Jim. Wouldn't now, except that the chapter is coming to an end in a few days and mebbe my telling it to you will help you to forget your own troubles a little while."

"It does help," said Jim.

"Not much use, to kill a brood of young rattlesnakes," resumed the sheriff, "unless you get the old ones, too. They'll just breed a lot more. As soon as I began chasing that gang that swindled me, I found that they was only part of a big machine, but for a long time I couldn't put my hand on the master machine. Finally when I got little Ernie Machias, he told me enough so I could begin to see where the trail went."

"Where was that?"

"To Speedtown," said Messenger.

Jim sat up in his chair with surprise.

"So I came back to Speedtown, and got me this job of being sheriff."

"Folks wondered how you got the nomination," stated Jim.

"That's part of the story."

Messenger got up and began to pace up and down the porch.

"Needed the rest, all right, God knows. But my job was not done yet. There could be no rest for me until the fangs were pulled of the worst snake that ever preyed on men and women."

"What do you mean?" asked Jim.

The older man paused in his excited walking, directly over Jim. When he spoke there was the deadly venom of years of accumulated hatred in his voice.

"What do I mean?" he said. "I'll tell you what I mean! Old Judge Rising stands at the end of a long trail, boy. He has played a pretty game, but his bluff is goin' to be called, and I'm the man that's goin' to call it!"

The boy sat forward tensely in his chair.

(Continued on Opposite Page)

What Happened in the Story Last Week

JIM Taylor's injury and the fact that he was caught apparently red-handed in Johnny Ball's milk house after the milk had been spilled and kerosene poured around the premises, is the main subject of discussion at the meeting of the Ladies Aid of the church of North Speedtown. In fact the strike is the main discussion, including Jim Taylor's impending trial. The conversation and discussion about the entire milk situation is at its height, when a telephone message brings information that Jim's mother had just died. At funeral services, Johnny Ball rather shocks the community in view of his trouble with Jim, by attending with his daughter, Dorothy. Dorothy sings at the funeral services and Jim, hearing the song, feels that she is singing for him. In fact, "the boy and girl were nearer in spirit than they had been before in many long weeks".

ably got quite a lot out of life, too. So much that I'll bet that most of them would have lived it over again had they been given a chance."

Then he stopped a moment while he fished in one pocket for his tobacco pouch and in the other for his pipe.

"And besides," he concluded, "there might be worse places than right here. These folks had their day with its play and its work, and when night came they laid themselves down to rest in this quiet spot, watched over by the sun, the wind and the stars. Pretty good place to rest; and rest is pretty good. And also, Jimmy," he added with a little twinkle in his eye, "They are the first peaceful folks I have found; nice, quiet, peaceable citizens!"

"But come on, boy, let's get out of here. Where are you headed for now?"

"Home to milk the cows," said Jim bitterly. "Not that I have much milking at this time of the year," he added. "Been stripping them out with one hand since I got hurt. 'Not even a death in the family can interfere with the daily grind of chores in the cow country."

"Good thing there is work to do," answered Dave cheerfully, as he got up and started toward the road. "It takes up the mind. I figgered, Jimmy, that mebbe it would be kinda lonesome up there at your place tonight, so I'm just goin' to invite myself to stay all night with you."

Jim made no reply for a moment, and the older man continued.

"Need a change myself, and a good visit."

The boy knew why the sheriff had invited himself to stay with him and was grateful. Maybe it would help.

"Glad to have you, Dave," he said, "If you are sure you want to. My sister is staying with one of the neighbors tonight, but Aunt Janet is stopping over for a day or two, and she can probably get us together something to eat if we are not too particular."

"Suits me," said Dave. "Used to rustlin' for myself, anyway."

turned out into the night pasture. Jim fed and bedded down his horses, and the two men went into the house.

Aunt Janet, aged but spry and cheerful, had put the rooms back into their natural order, and had a warm supper on the table. They all sat down, Dave still talking of past experiences. He and Aunt Janet visited so cheerfully and to such purpose that Jim had eaten a good supper almost before he realized it.

It was a warm October evening, and after supper, the two men lighted their pipes and in comfortable chairs, with feet on the old porch railing, they sat in silence enjoying the soothing influence of the quiet evening.

After a time, Dave said: "Jim, ever hear how I came to settle in Speedtown?"

"No," said the boy. "I heard some stories about your chasing some swindlers around the world, but I never heard anything that wasn't to your credit, and I never heard why you happened to settle here."

"Never told it to anyone before," said Dave, "except to Winslow, and I only just told him the other day. But I sort of feel like talking tonight, and if you want to listen to the ramblings of an old man, I might tell you."

"Go ahead," said the boy. "I'd like to hear it."

There was a little silence while Dave puffed reflectively a few minutes on his pipe.

"Probably you've heard," he resumed, "how some fellers came to visit me back in the days when I was ranchin'. I'd always been used to takin' everybody at face value. These boys seemed to be likely fellers, and I took quite a shine to 'em. Wife said right from the start that there was something about them she didn't like. Funny how some women sense things that don't appear on the surface, ain't it?"

"To make a long story short, after they'd been around a while, they put up a phoney deal and I fell for it; took about all of my money, even had to sell

"So that's it!"

"Yes, sir, that's it. You people here hate him because of what he has done to business and politics in this section. But that was just small peanuts to him. Folks think that he has a hundred thousand dollars or so. The fact is, he is several times a millionaire." The sheriff paused and then concluded his sentence, emphasizing every word, "and it's all blood money! He got it by directing an organized gang of swindlers and bunko men, whose dirty hands have robbed needy folks in almost every city in America. He lived in a rural section like this so that no one would suspect him."

As if his vehement speech had made him a little ashamed, the sheriff turned and sank into his chair.

"But now I've got him," he said quietly. "I gave the facts to lawyer Winslow yesterday, and he wanted me to wait until after election. I can't do it. Waited too long now."

The sheriff kept quiet for so long that Jim thought he was not going to continue.

"Still I don't see, Dave, how you got to be sheriff."

"All I had to do was to drop a hint to the judge that I knew a little something. He doesn't know how much. But he didn't dare interfere with the nomination."

"So all you wanted of the sheriff's office was to bide your time to expose the judge. Is that right?"

"Yes," said Messenger.

"When is the exposure going to take place?"

"Sorry, but I can't tell you that. You and Winslow are the only ones that I have ever told anything about this. Say nothing for a few days, and then I don't care who you tell."

The sheriff stopped talking, and with the end of the story Jim's own troubles came back to him.

"Speaking of Winslow," he said, "you know after—after Mother—died, Winslow went to Judge Rising—and tried to get my trial postponed—for a few days."

"Yes," said the sheriff. "I know all about it. I might add, too, Johnny Ball came stumping into town yesterday and after talking to Winslow he went right up and bearded old Rising in his den, and also demanded that your trial be put off."

"And the judge wouldn't do it," said the boy. "Bury my—mother—and go on trial—all in the same week. . . Nice life."

"There, there," said Dave. "I wouldn't feel too bad about it. Might as well have all your troubles in a bunch and get them over with. Your case was listed on the calendar on the regular term. It might be a little hard to change it, and after all, there ain't much point in changin' it. Besides, old Rising made a mistake. His keepin' your trial on the calendar just to be mean may help you. All of this will make sympathy for you, and say what you want to, sympathy counts with any jury, especially when there ain't nothin' against you but circumstantial evidence."

"I don't want any sympathy," suddenly flamed the boy. "All I want is a little justice."

"Goin' to git that, too," soothed the sheriff. "But better go to bed now, hadn't we? Been a hard day. Need your rest."

Jim stood up and stretched. He felt sore all over, and tired, as if he had been through a long sickness.

As the two men stood looking out into the night a moment before they went inside, there came a patter of rain on the tin roof of the porch overhead.

"Seems as though I—I—I can't—stand it Dave—to have—m-m-mother

—out there in the rain."

The little sheriff reached up and put his hand on the boy's shoulder.

"There are worse things, Jim, than the sun and the wind and the rain. Besides, she's where she doesn't mind—so come on now, let's go to bed."

A little later, as Jim lay in his bed, before the sleeping of emotional exhaustion claimed him, it seemed to his over-wrought imagination that he could hear a girl's voice singing, low-toned, deep-throated, beautiful:

"So long Thy pow'r has blest me, sure it still

Will lead me on

O'er moor and fen o'er crag and torrent, till

The night is gone."

And as he listened, it again seemed true that Dorothy was singing for him, and for him alone.

CHAPTER XXV

Sheriff Messenger stood in the door that led from the big courtroom into the entrance hall. This hall was packed with men, and the little sheriff was

Riverside Oversize Tires and Tubes

Read what the users say

Does a Riverside Cord last as long as any tire? Is it as good a tire as any tire made? Is it as well made as a tire can be made? Tens of thousands of users of Riverside tires answer enthusiastically—"Yes!"

Just forget that our prices are low. Compare quality, service, mileage—tire for tire, and Riverside Cords stand equal to the best. There is a big saving in price—and the quality, mileage, service is all that you get in any tire.

How our low prices are made

Riverside tires cost as much as other tires to make. You pay as much for fabric, rubber and labor. But you pay less profit. That is why Riverside prices are so much less. We are the largest retailers of tires in the world. We sell 5,000 to 6,000 tires per day. Riverside Tires are made in the best factories—on our specifications, under our supervision. We know their quality.

Greater Protection against Skidding

Big heavy blocks of live rubber and extra thick side studs and the husky ribs of Riverside Cords grab the slippery roads and are your greatest protection against skidding.

Riverside Cords are thus the safest tire, the most satisfactory tire and the most economical tire you can possibly buy. Why pay more?

For 53-years Ward's have sold "Quality" goods only—with a definite "Money Back" guarantee.

The reliability of Montgomery Ward & Co. is beyond question. You can not buy a tire with a better guarantee.

"A pair of Riverside Cords have already given me one year's service on rough mountain roads, and they have never been off my car. You can't beat Riverside for good road service."
James A. Kipe,
Cascade, Maryland

"The Riverside Cords I bought last Summer show very little wear. High-priced tires put on my car at the same time are all gone. I tell my friends to use Riversides and get their money's worth."
Chas. F. Poor,
Danvers, Mass.

"A Riverside Cord on my Buick, with your heavy duty tube, has run 15 months, in use every day, and it still has in it the same air put in 15 months ago. 'That's going some!'"
D. S. Robbins
Las Cruces, N. Mex.

Life's Pay Checks

A Sunday Visit with the A. A. Philosophy Man

Editor's Note: Dr. By REV. J. W. HOLLAND a hole in your pocket, Holland will be glad or the failure of a bank may blast your happiness. The Bible tells us, "He that longeth for silver shall not be satisfied with silver."

BEFORE we get anything out of life we have to put something into it.

What we put into life is our personal interest and work. The things we take out depend largely upon the value set upon us by others. There are three checks that we may all receive for our part in the work of the world.

The first one is material. We call it cash or gold. It is necessary to pay the bills as we go. Yet, how few of us ever reap large wealth as the result of our toil. Most large fortunes are collected from society rather than really earned, and they rarely bless their possessors, or their children.

If wages is all you get for your work,

The second pay check is worth more. It is the inner joy we get out doing our "stint of toil." Blessed are ye who love your work enough to whistle or sing about it.

I pity the poor souls who get no "thrill" out of sweeping a floor, plowing a straight furrow, stacking grain, baking a good cake, washing a child's face, or writing a sermon.

The big pay for doing a good thing is in feeling good while doing it.

If you get pleasure out of your work, envy no mortal on the planet.

The third check we get is the appreciation from others of the value of our toil.

A successful business man who has a large family to educate said to me recently, "I seem to be only an animated check-book."

What that man needs is what all people need—loving appreciation for the work he is trying to do.

The prophet Isaiah said, "They help

American Agriculturist Crossword Puzzle

Series 2, Number 3

Copyright American Agriculturist, Inc.

This time there are four 9-letter words! Pretty soon, you'll need a Webster's Unabridged! But you use all four of these words many times during a day, so it should not be hard to guess them in a puzzle. Then there are four 6-letter words leading in from each rim to the center, and everything else from two letters up. Unless your head is absolutely No. 24 down you will not be stumped by this puzzle!

ACROSS

- 1 Out of danger
- 5 Bit to subdue
- 8 What we go to school for
- 13 They exist
- 15 Heads
- 16 Take part in a play
- 18 Southern State
- 19 Pronoun, feminine
- 20 Exclamation
- 21 Preposition of place
- 23 Radiated light
- 25 Indefinite article
- 26 Part of the ear
- 28 Angry crowds
- 30 Small animal
- 31 Plant just coming up
- 32 Horse's favorite diet
- 34 Part of a school year
- 35 Time since the birth of Christ
- 36 Valuable dark wood
- 39 Chemical symbol for tellurium

DOWN

- 40 Degree of a minister
- 41 Before
- 42 Right (abbr)
- 44 Employ
- 46 Causing death
- 48 A straight
- 49 Selling produce to consumers
- 52 Praise
- 53 Curved
- 1 Fasten firmly
- 2 Doctor's payment
- 3 Boy's nickname
- 4 Nautical measure of distance
- 5 Company (abbr)
- 6 Character in one of Chaucer's writings
- 7 Two
- 9 Opposite of down
- 10 Money
- 11 Age between ten and twenty
- 12 Exists
- 14 Carriers on which produce is shipped
- 17 City people awaiting produce
- 22 Member of a wandering tribe
- 23 The best kind is
- 24 Nothing inside
- 25 To bear prematurely
- 27 What goes in a horse's mouth
- 29 Crude metal

Solution of Last Week's Puzzle on opposite page.

Don't blame your children

if they decide that life on the farm is not worth while

HERE IS FAIR WARNING: Every year thousands of young men and women, brought up on farms, move to the cities. In the cities they can find the comforts they demand. On the average farm they cannot.

It's up to you to make life on your farm worth living.

And the one greatest, single step toward comfort and health and happiness is Colt Light.

Colt Light is clear and soft. It lights without matches at a touch. It makes every room livable twenty-four hours a day. It reduces morning and evening work a third.

Colt Light brings with it a small carbide-gas stove that is

ready for work whenever the fire in the coal range is low. It brings also the Colt iron that heats itself quickly and makes ironing easy.

Yet it costs less to install on the average farm than the cheapest automobile. And it costs less in operation than enough kerosene lamps to light the house properly.

Union Carbide for use in the Colt light plant is sold direct to the consumer at factory prices. One of the 175 Union Carbide Sales Company warehouses is located near you. Union Carbide is always uniform. World's best quality. Highest gas yield. It is always packed in blue-and-gray drums.

Variety Adds Spice

Why Not an Herb Patch In the Garden?

EDITOR'S NOTE: A well-filled herb garden and consequent well-filled jars of dried herbs or their seeds DO present such possibilities for us who must often rack our brains in order to vary the family diet and keep appetites appeased.

We can learn much from the French who have mastered the art of making delicious stews and sauces. Most of us content ourselves with a few tested and tried flavors and seasonings and don't realize just how much pleasure we deny ourselves by not using freely what we could so easily have, herbs to furnish variety to the menu as well as to the garden.

The skill of the local herb doctor is almost a thing of the past, so let us usher in the art of herbs in cooking!

EVER so often we find the poets and romancers crying that one give them—

—a garden, an old-fashioned garden,

Where the thyme and the balm and the sweet-basil grow—

and ever so often, in very considerably-increasing numbers, Anglo-Saxon countryside about, you, who may have an eye out for the same, will discover gardens of exactly that sort!

Ever since the Great War, particularly, people very nearly everywhere have been brought to realize that it does not detract from beauty at all that things comprising it should be useful as well!

Tansy at the far rear fence-line is quite as lovely as the yellow daisy: a touch of tansy gives a tang to the vegetable pottage whose savor cannot be denied.

Marigold is assuredly quite as lovely for the garage wall or the barn-edge as the cosmos or the coxcomb; you may not need a very great deal of it on your kitchen shelf, but it's never a bad idea at all to share tidbits with the next neighbors around.

So with other and other and yet other sweet-pot and aromatic herbs; until today certain of the big American seed concerns serving space squarely in their catalogues for the plants of this sort, and urging folk to set out their seeds. As a particular inducement to this cultivation, it is indicated that the very largest part of such plants are perennials; and that once obtained in the garden they may be preserved there for years.

"A" Stands For Anise.

Just what, then would these good experts recommend for such a garden and how should one care for the same? Taking the list as we find it given, there is the lovely anise first of all. You who seek a border for, say, the cannas at the porch front or the geranium bed at the side, cannot go amiss with the anise.

"It is used medicinally", we read, "as an agreeable aromatic; the official part of the plant being the fruit. This is known by the name of 'ani-seed', and has a strong aromatic taste and a powerful odor. By distillation, the fruit of the anise yields a volatile, oily matter known as oil of anise".

Incidentally, lest the white ribbon friends have a compunction against anise in the garden because of the liqueur bearing that name, it is remarked that the 'star-anise' of the beverage manufacturers is a wholly different plant, belonging to a different order, in fact. It derives its name from the flavor and from the fruit spreading out as might a star.

Dill Is An Old Timer

The dill,—so profitable to the lover of pickles and the like for proper season, for his garden,—was one of the garden plants with which the Pharisees were wont to pay tithes. Along the use with the pickle, as given, it serves as an admirable spice or savor to soups.

'Balm' for the garden side, where of the lady-slipper type, needs no recommendation to garden lovers where so'er.

Lest you consider it commonplace, recollect that authorities tell us there are no less than a hundred thirty-five listed varieties of this plant. What is more, it 'may be trained, by pinching and pruning, into various shapes, making it bloom the more profusely and adding to its appearance.'

Stems of the one species the FULVUS IMPATIENS, were used by the English for tumors, to reduce inflammation, and there is a strange balmy, soothing, relief come by the use of almost any of the rest. Touch-me-not, or snap-weed is one of the family here; no garden can suffer for the flowers and the strange pods, that burst apart on merest touch!

Borage, Not Barrage

Follows on the balm, the borage. 'No one, ever tasting the soft, downy delectable leaves of this plant, thoroughly sours by the vinegar of a salad will be willing to forego the treat again.'

If horehound and similar plants are ornamental, then is the borage also.

Borage is, by origin, a European herb, somewhat stout and coarse perhaps in appearance, true, but making up for all of this with its charming blue flowers.

Familiar Names Appear On this List

After borage comes the sweet basil and the caraway. The basil species are all of them natives of the tropics or of the warmer temperate parts of the world, and are characterized by the pleasant aromatic smell and taste.

Like other plants of the group, they are cultivated for culinary purposes most of all, being used in seasoning;—but they form no ill addition to the garden, especially were tucked in to cover some otherwise uncovered nook of ground.

Caraway is almost too familiar a spice for more than the mentioning here.

Space forbids the detailing characteristics, story and uses of all the other plants on the list. The roster, however, as it stands, is interesting and helpful:

Catnip—alias catmint
Chervil—for flavoring soups, etc.
Coriander—seeds aromatic
Fennel, Sweet—seeds for flavoring.
Fennel, Florence—flavor like celery.
Hyssop—Medicinal qualities.
Horehound
Lavender—for oil and water.
Marigold
Marjoram (American sweet)
Opium poppy—for seeds on rolls.
Rosemary—Aromatic oil.
Rue—has medicinal qualities.
Saffron—Medicinal uses and dye.
Sage—Culinary herb, much used.
Sorrel—Cultivated for acidity; used in salads.
Summer Savory—Culinary herb.
Winter savory.
Tansy for bitters.
Thyme—breaded.

Out of which you may make what selections eye or palate suggests. Any of them will re-pay the planting.

Styles That Bloom in the Spring

And What Women Does Not Wish To Be a "Flower of Fashion"?

WHILE it is a bit early to don new spring clothes, it is fun to peck ahead on the calendar and to hear about the lovely new things that are waiting for you in the city shops. Such a choice of fabrics and designs! And such colors! The most unusual shades of red, blue, orange, green, and violets weave the very spirit of springtime into fabrics and garments.

Of course you find the colors dressed up in new names. Pervenche blue is really a first cousin to the periwinkle and powder blues so popular last season. Ginger-snap brown is a direct descendant of that delicious snap found in our grandmother's cookie jar. Wigwam is another new brown, and tiger-eyed tan used in many of the spring coats, is a relative of beige and light brown.

Red holds a decidedly important place among the spring colors. Some shops say that it will be a red spring. It is seen in the brightest shades of Chinese lacquer for sport clothes to the duller brick tones for trimmings.

Grey is better than ever. Navy, tan, and black still hold favor. Pastelle shades predominate in flannels, kasha, serges and similar fabrics for sports wear. Salmon, sage, turquoise, yellow, geranium, and tea-pot dome green come in deeper shades with something of a chalky appearance that makes them less daring and more becoming.

Kasha wins the popularity race in fabrics. This material resembles flannel though much softer in texture. It is used in the natural shade and new colors for ensemble suits, sport dresses, top coats, and capes.

Jewel-tone, as the name suggests, is another new fabric resembling kasha that comes in the colors of the semi-precious stones. French flannel, sport serge, Poirer twill, homespun jersey, and fancy stripe and plaid skirting material sum up the worsted fabrics.

2. New—and Old—Fabrics

Bengaline and faille are the heavier silks used. Satin canton crepe, broadcloth, Deauville prints, and summer-frock silk, which is another name for the wash-stripe sport silks, are the last words in silk.

Prints range from conventional floral patterns to bold geometrical designs. Some come in 56-inch width with border designs. Dresses of prints require little trimming. They make effective and inexpensive frocks for afternoon and evening wear. Some of the striped silks are especially designed for pleating, so that a contrasting color shows only when the pleats are stretched apart.

The silhouette remains straight with some variations below the knee line which take the form of flares, panels, and flounces. Sometimes the fullness is introduced in box pleats or inverted side pleats. Many silk dresses show pleated flounces and pleated aprons across the fronts, leaving the backs plain.

Skirts are still short, ten or twelve inches from the floor being the average length. Of course, the length really depends on the size of the person.

3. The Elusive Waist Line

Dresses still feature the beltless waist-line, although a narrow belt occasionally is introduced across the back.

Sleeves are decidedly long. Some are tight fitting and button trimmed, some are bishop style, and others end in charming little puffs. The dressier frocks and those for warm days are sleeveless or show just the mere hint of

a sleeve in the form of a band or cuff. Keeping in mind the woman with the limited income, I selected one of the new ensemble suits of navy blue twill. The boyish coat with tailored lines has a rever collar, set-in pockets, and straight set-in sleeve.

Inverted pleats on each side add extra fullness. Bone buttons trim the sleeves and side pleats. It is lined with Pervenche blue crepe faille. The dress of matching faille is a straight-line, beltless style with a round neck embroidered in gold and deep blue.

According to the panels of tan satin crepe lend interest to the skirt. An embroidered chenille flower with leaves of faille on the lapel helps to soften and feminize the severity of the coat. This full-length coat would make a serviceable top coat to wear over the street dress of twill and, with the matching dress for afternoon and evening. Mrs. Limited Income's wardrobe is complete.

There were other attractive ensemble suits of kasha in tans and greens and brick shades, but I felt that the dark suit would be more practical. One I particularly liked was of tan kasha. The coat, double-breasted with tailored collar, was the same length as the skirt of the frock and was lined with plaid flannel. The dress was of plaid and trimmed with kasha.

The coat I selected is of Jewel-tone in tan-grey trimmed around the bottom with grey fox. The collar is trimmed with a tailored bow at the back with the tie ends extending underneath the

like. It was of brick-red flannel with perfectly straight lines, a small belt across the back, very short sleeves, and a high military collar. It had a two-inch panel of black flannel straight down the middle of the front, faced on each side with one-half inch stripes of white flannel. The collar and sleeves and small tailored pockets were edged with black and white flannel. The effect was very smart.

Many of you will wish a print dress so I chose this becoming afternoon frock in red, black, and white. It is cut perfectly straight with a set-in sleeve. Self material is used for the four-inch accordion pleated ruffle which forms the jabot effect down each side of the front and trims the sleeves. Wider pleated ruffles are used across the front. By the way, jabots take first place for trimming. They may be pleated frills of lace, Crepe de Chine, or the more tailored effects of linen.

Costumes for the six-to-tens carry out the delightful idea of playing that they are grown up. And really, these six-to-tens feel grown up in their ensemble suits which consist of top coats of flannel in tan, red, green, or blue with matching frock of Crepe de Chine. The child's ensemble suit illustrated consists of a tan flannel coat with tucked flannel for collar and cuffs. It is lined with self-colored lining. It makes a practical coat to wear over wash dresses of gingham and linen.

The matching dress is of tan crepe de Chine with a panel of brick-colored crepe down the front. Crochet buttons are of brick-colored yarns. Groups of pin tucks and a band of embroidery in brick-colored yarn make the little frock delightfully dressy.—Leonore Dunnigan.

Life's Pay Checks

(Continued from Page 250)

every one his neighbor; and every one saith to his brother, Be of good courage. So the carpenter encourageth the goldsmith, and he that smootheth with the hammer him that smiteth the anvil, saying of the soldering, "It is good."

Think of the thousands whose lives are drudges, because no eye brightens

Left to right: Deauville Print Afternoon Dress, Sport Dress of Tan Jersey, Child's Ensemble Costume of Tan Flannel and Crepe de Chine, Coat of Tan Grey with Squirrel Trim and Miss Ensemble of Navy Twill and Pervenche Blue Crepe Faille.

wide revers. Chenille flowers in dull green, tan and grey decorate each lapel. It is lined with tan-grey broadcloth crepe.

Sports frocks are very simple. I hope you will like the two-piece jumper style of tan jersey trimmed with bands of bottle-green and copper-red jersey. It is a charming costume for the school girl. The skirt is straight and narrow and finished at the top with an elastic band. The jumper overblouse is close fitting over the hips with a straight rever collar, long tight sleeves, and slot pockets. One of the new Directoire ties, which is a big bow tie made of silk, can be added.

I saw another dress I think you would

when they come near, and no lips thank them.

Think often of our very own loved ones, who long for us to tell them, as Christians should that their love and labor are of great value in the world.

They who receive no gold for their toil must beg or steal. They who cannot smile over their work grow scar and dry of soul. They who receive no appreciation for their toil inwardly die.

Verily, the last pay check is the most valuable. We live for those who love us, but we die without appreciation.

Brethren, let's all PAY UP!

As Spring Approaches

The Garden Must Be Planned And The Wardrobe Replenished

Some Day

Some day she will go out and close the door.
The red geraniums press against the window pane
Watching the path she lightly trod.
The vines that clamber o'er the porch,
Look eagerly within those quiet rooms,
Where she comes not again.
The sleepy cat will yawn upon the couch,
Its paws upon an open book.
The lilacs whispering in the breeze,
Tell how she kissed their perfumed petals
As she passed,—but broke no strand,
So tenderly she lived and loved,
So tenderly she passed.

—Louisa Oliviere.

The Early Garden

MRS. GEORGE GRAY

THOUGH the thermometer registers 12 below and the winter winds are blowing it is none too early to begin next summer's garden if we want the early vegetables. And when do they taste better than the first yield? And the earlier that yield, the better they taste.

The first move towards the early garden is the selection and ordering of seeds. As the season advances, orders increase and we do not get as prompt attention, and we may not have the seeds when we are ready to use them. It is well to have our supply of seeds by the middle of February. In fact, I try to have my tomatoes and peppers sowed at that date. I have been quite successful in raising tomatoes and think the early sowing is an important factor.

The supply of soil is stored in the cellar in the fall. When wanted, I heat it in the oven to destroy worms or bugs that might destroy the young shoots. After it is thoroughly cooled it is pulverized and put in wooden boxes or dishes and sprinkled. After a few hours the seeds are scattered over its surface and lightly pressed with the hand. The pulverized dirt is gently sprinkled over them, using just enough to cover. If the seeds show later, a little more dirt is sprinkled on. The box is then put in a warm place and a paper laid over it for the purpose of keeping moist.

When to Transplant

As soon as the seeds begin to sprout, the paper is removed and the box brought to the light. When the plants are developing the third leaf, it is time to transplant them. The soil is prepared as for sowing and they are placed in rows, the plants at least two inches apart. Give them all the sun available and keep them growing steadily. When they begin to crowd, transplant again, either in the hot bed or in pots. In central New York it is hardly safe to put out in the ordinary hot-bed of the farmer, for we often have zero weather in early spring. When it is safe to put outside, I prefer the cold frame as the plants are more sturdy and stocky.

Transplant on Cloudy Day

We aim to set our plants in the ground on a cloudy day or at close of day. A hole at least a foot deep is dug; the ground pulverized and a quart of water poured in. On this the plant is set and dirt pulled around it. Fully half the length of the plant is under ground. The dirt is firmed around the plant, a stake driven and the plant tied to it. A soft string is used. It is placed around the stem, the ends crossed and

tied around the stake. This leaves the stem of the plant in a loose loop which gives room for growth and still holds it upright. If the sun is shining, papers are pinned around the plants cornucopia fashion and they will start growing without wilting. This is a great help as there is usually a set-back of ten days, or a week. The very earliest tomato is the Earlian, but its season is so short that many prefer Bonny Best or Chalk's Jewel. Our seasons here are so short that it is not safe to depend on the later varieties, although they often ripen. Tomatoes like everything else, respond to cultivation. The more they are cultivated, the earlier they fruit.

Peppers require about the same treatment as tomatoes while in their infancy, but require more heat.

Lettuce, cabbage, cauliflower, onion and beet are easily grown inside if too much heat is not applied, they may be

ways free from bugs, worms and insect growth, and an occasional pan or pail of dish water seems just what they need. —L. M. T.

Mending Helps

OFTEN the silk toes and heels of the baby's wool stockings wear out, leaving the wool as good as new. When this happens, cut the worn silk part out and using a crochet hook and mercerized cotton, work doubles into the wool close together, making as many rows as are required for toe and heel, shaping carefully as you work.

If wool stockings—of any size—are each dried separately on a last, they may be darned when necessary before removing from last and it is a help for smooth neat darning.

When making up table linens save any piece that come off when making

Comfortable Clothes for Mother and Daughter

No. 2379, a school frock, cuts in sizes 6, 8, 10 and 12 years. Size 8 takes 1 1/4 yards of 36 inch material, with 5/8 yard contrasting. Pattern, 12c.

No. 2314, a "Sunday best," cuts in sizes 6, 8, 10, 12 and 14 years. Size 8 requires 1 1/2 yards of 36 inch material, with 5/8 yard banding. Pattern, 12c.

No. 2361. This one-piece every day dress has sensible pockets and may be used with either long or short sleeves. It cuts in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 takes 2 3/4 yards of 40 inch material with 3/4 yard contrasting. Pattern, 12c.

No. 2280. A nightgown with kimono sleeves or long sleeves is suitable for warm winter fabrics or sheer summer ones. This pattern cuts in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 takes 3 1/4 yards of 36 inch material. Pattern, 12c.

TO ORDER: Be sure that name, address, sizes and numbers are written clearly and correctly. Enclose correct remittance in stamps (coins sent at own risk) and mail to Pattern Department, AMERICAN AGRICULTURIST, 461 Fourth Ave., New York City. Add 10c if you want (and you surely do want) our big new spring catalogue, with pages of designs for every member of the family. It will go to you at once. (Patterns and catalogues are mailed separately.)

transplanted in a cold frame and from there to the open ground.

If we have the room to house our seedlings, there is no reason why we should not have our gardens at least two weeks earlier than is usual. One year I had corn five inches high when the garden was made. I planted it in berry baskets and cut them apart when corn was transplanted. Cucumbers were grown the same way.

Let us not forget to cultivate if we want results. While the plants are young, a table fork is fine for stirring the soil.

Waste No Space

Along the back of the house or close up to the kitchen porch there is a space where grass refuses to grow. Because of the hot afternoon sun nasturtiums do well there but their season is short and they have a habit of climbing where they choose instead of where you want them.

Try a dozen pepper plants instead. Their glossy green leaves are always beautiful. They have a small blossom and the growing peppers are good to look upon. In addition, they are al-

the edges even. Ravel these pieces and use the threads thus obtained for mending linens that need darning.—Mabelle Robert.

Service Department

How to Get a Federal Farm Loan

We have bought a farm of eighty acres with fairly good buildings, good location, timber and other assets. Now the man from whom we bought needs his money and we wish to obtain a federal loan or similar loan. Could you put us in touch with a federal loan agent or other agent who is responsible.—G. W. S., New York.

YOUR first step will be to get in touch with the Sec.-Treas. of your local Federal Loan Association. I cannot tell you who this is but feel very sure that if you will apply to your Farm Bureau Agent, he will be able to give you the information. Then the local Loan Committee will make a preliminary examination and appraisal of your farm. If their report is favorable, the Bank at Springfield, Mass. will direct a Federal Appraiser to come to your farm and the amount they will be willing to loan will be determined primarily by his report.

It is too bad that the Bank cannot loan every worthy man what money he really needs to take care of his pressing requirements but hard business sense requires that great care be exercised in making these loans and in spite of this fact, the Bank has a considerable number of foreclosures to take care of.

How Much Can Be Borrowed.

The Act under which the Federal Land Banks (as well as the Joint Stock Land Banks) are established provides that loans can be only first mortgages and cannot exceed fifty percent of the value of the land plus 20 percent of the value of the buildings. In addition to this, small additional values may be granted for thrifty, well cared for orchards or for woodlands of prospective and immediate value. Very many factors enter into the valuation of a farm. On some very hilly, remote, poor farms the Bank has very properly taken the position that no loan can be granted because under present conditions such farms are almost without quotable value when thrown upon the market. However I know the Bank has a sincere desire to help every deserving man just as far as is consistent with sound business and justice to their other borrowers. Of course the most desirable loans are on moderate sized farms close to villages and if possible on state roads.

Must Furnish Abstract of Title

You will be asked to make a deposit of \$10.00 to partially cover the cost of appraisal and other local expenses and if your loan is denied, you lose your ten dollars. If your application is accepted by the Bank, you will be asked to furnish an abstract of title showing that no other claims stand against the farm such as unsatisfied judgments or missing heirs or unprobated wills—in other words that there is no possible cloud on your title. Also you will have to purchase "stock" in the Bank to the amount of five percent of your loan but this is not a fee but a gilt edged investment as it will draw dividends and the amount will be deducted from your last payment.

Debt May Run 33 Years.

Ordinarily you will take the form of mortgage which calls for an annual payment of 6½ percent, this being interest at 5½ percent and also one percent on the principal. This is the Amortization Plan which is the distinguishing feature of Land Bank mortgages and by it the debt is extinguished at the end of about 33 years although the entire sum or any part of it may be paid at any time after five years.

I admit that this all means a certain amount of red tape—more than I wish was required. The advantages are a rate of interest lower than you will be apt to get from a private loan and in

addition a very small annual payment and the fact that you are not troubled by the matter of renewals.—Jared Van Wagenen, Jr.

An Unjust Law

A SHORT time ago a friend died leaving a wife, and a small house and lot in a village in this state, but no children and no will, but brothers and sisters. Now this house and lot came from the wife's people, but the title was put in the husband's name. According to the laws of the state of New York this little home must be sold and the proceeds divided between the brothers and sisters of the deceased. The poor wife got the use of One Third of the proceeds. Not one dollar was ever put into this home by any member of the husband's family, nevertheless it is taken from the wife and given to these brothers and sisters and she is left with the interest of one third of \$1,200, what this home brought.

About three years ago an old man who owned a rather poor farm died leaving a wife, no children, and no will, but a brother. The wife who had done her full share to make a home of this farm had helped to pay for it, bearing her full share of the burdens was given one third of the rental of this farm. The balance went to the brother. She rented a house in the village, but soon found that the rent she received from the farm would not pay the rent on the house in the village. The little personal property was used up in paying bills and funeral expenses, and the poor old wife, without means sold her household furniture and went to live in an old ladies home. (Next door to a Poor House). The brother has the farm.

Women Should Demand Change.

The women of New York, suppose to have equal rights with men, should arise in their might and demand that these laws be changed.

They were made at a time when women were suppose to have almost no rights. They are out of date, obsolete, and should be changed. The only rights that a married woman had when these laws were made were what her husband chose to give her. But times have changed. Women have come into some rights, but these laws remain the same as they were a hundred years ago. Demand a change.—G. E. D., New York.

Fraudulent Chicken Remedies

The U. S. Postoffice Department has issued a fraud order covering alleged cures for poultry diseases which will meet the approval of farmers, poultrymen and the legitimate advertisers of poultry supplies.

The particular fraud order in question was issued against the H. M. Spahr Estate of Thurmont and Spahr, Maryland, for representing its products as "the most scientific drugless cure that has ever been discovered for the deadly roup, colds, canker, diphtheria and chicken pox."

Recommends the Service Department

I wish to thank you for the service you have rendered me. I feel very grateful to you as I know that if it had not been for your service, I never would have received anything for my turkeys.

I am willing to pay you for your service, but have read so many times that you would not accept pay, so I know there is no need to offer it. I certainly can recommend your services to anyone.—J. S. L., St. Lawrence Co., N. Y.

130,000 Owners

A century ago a 17-mile railroad was built from Albany westward. It was valued at \$165,000. This was the beginning of New York Central.

Today this vast railroad system of 12,000 miles extends from the Atlantic seaboard to the Great Lakes and the Mississippi Valley, and now represents a value of more than \$2,000,000,000.

The upbuilding of this great enterprise has been the work of many investors through generations. Today there are more than 130,000 individuals and institutions owning the securities of the New York Central Lines. Thirty-six thousand investors own the stock of the New York Central Railroad Company; in addition, more than 41,000 employees are becoming stockholders in the company.

Old Leaky ROOFS

Made Like New

WITH **Saveall** LIQUID ASBESTOS ROOFING

It makes no difference what kind of roofs you have— SAVEALL ROOFING, will stop the leaks—stop the damages—stop the repair bills and save you the cost of buying a new roof.

We will show you how to SAVE and RENEW every one of your old, worn-out, leaky roofs with SAVEALL Liquid Asbestos Roofing, for just about one-fifth the cost of a new roof—and we will do it—prove it 4 months before you pay.

SAVEALL ROOFING comes in liquid form ready to spread. It is composed of genuine rock fibre asbestos combined with gilsonites, minerals and pure asphaltum gums, made under our own special process. A roofing brush is all you need to apply it and when spread on your roof it penetrates and covers every crack, crevice, joint or seam, nail hole or rust spot and makes your old roof just as good as new.

4 Months Trial Before You Pay

FREE

With every order sent in from this advertisement, we will also include Absolutely FREE a Roofer's Brush for applying Saveall Roofing and a 25 lb. drum of our Plastikite Patching Cement for patching leaks around chimneys, flashings, gutters, cornices, etc. Send coupon at once and get this FREE Roofer's Brush and Patching Cement.

One gallon of SAVEALL covers an average of about 70 square feet of roof surface.

You take no risk when you put SAVEALL on your old roofs. We will ship you all the SAVEALL you need without a penny of pay in advance. You put it on and then after four months' trial you pay only if pleased. If not satisfied—you say so—we will cancel all charges and you won't owe us a cent.

GUARANTEED 10 YEARS

SAVEALL Roofing has been sold on this liberal "4 Months Before You Pay Plan" for years. It gives you a new roof surface which is not affected by heat or cold, does not rot, rust or decay and is guaranteed for 10 years. SAVEALL is furnished in Black only and is shipped in Steel Barrels or Steel Half Barrels. One gallon will cover about 70 square feet of roof surface. Never sold by Jobbers, Retailers or Salesmen. You buy it direct from the manufacturers—use it four months before you pay, and get our lowest factory prices.

Make a sketch showing the arrangement of your cow barn and send it along with the information requested below. You will find it convenient to lay a thin sheet of paper over the ruled space below, using the cross lines as guides.

NOW that you are planning your work for the coming season you are looking for ways and means of increasing your profits, by cutting expenses or producing more. If you are milking 10 or more cows a De Laval Milker will help you do both. Plan now to get along with less help by installing a De Laval Milker, or plan to keep more cows with the same help you now have. Send us the information requested below and we will gladly send you, without obligating you in any way and free of charge, plans showing just how a De Laval Milker should be installed in your barn, and approximate prices. Then if you decide it would be cheaper to hire a De Laval Milker than to hire extra labor, you will have plans which will insure proper installation and satisfactory work.

A Wonderful Money Maker for Dairymen

Thousands of users say their De Laval Milker is the best investment they ever made and that they wouldn't part with it for twice its cost; many go so far as to say they would sell their cows if they couldn't have one. Your only regret after you put a De Laval Milker to work will be that you didn't get one sooner—and the longer you use it the better you will like it.

Conservatively figured, a De Laval Milker will make at least \$20. per cow per year in saving time and increased milk which usually comes as a result of its use and because of its regular, stimulating and soothing action. A De Laval Milker usually makes much more than this, frequently saving one or more men.

In addition, when it is considered that cleaner milk can be produced, that the drudgery and dislike of hand milking are eliminated, and that dairying is made more pleasant for owner, son or hired man, you have the answer why so many people are installing De Laval Milkers.

Answer
these
Questions

Prices Reduced

Owing to the rapidly increasing use and popularity of De Laval Milkers, savings in their manufacture have been made which make possible reduced prices for 1925. There is now no longer a good reason why any owner of 10 or more milch cows should be without a De Laval Milker.

You Can't Get De Laval Results Unless You Use A De Laval Milker

It is possible to get mechanical milkers for less than the first cost of a De Laval—but you can't possibly get the same results. There are now more than 25,000 De Laval Milkers in use, and

- we have never known of one to injure a cow;
- the action of the De Laval is so pleasing and stimulating that cows almost invariably produce more milk;
- the De Laval is practically fool-proof and does not require a skilled operator;
- it not only milks better but faster, thus saving more time;
- it is easy to wash and keep in a sanitary condition.

Therefore, the De Laval is by far the cheapest in the end.

Gentlemen:

Without obligating myself in any way, I am sending you the following information, together with a sketch of my barn plan, with the understanding that I am to receive a drawing showing how a De Laval Milker would be installed in my barn and the approximate cost.

1. State maximum number of cows to be milked.....
2. How many rows of stanchions to be fitted up?.....
3. How many cows or stanchions in each row?.....
4. How long is each row of stanchions?.....Feet
5. How far between the rows of stanchions?.....Feet
6. Is there an alley from side to side?.....In center?.....On end?.....
7. Is there anything to prevent running a pipe line from stanchion row to stanchion row?.....In center?.....At end?.....
8. How high above the stanchion row will it have to be placed?.....
9. Have you steel stanchions?.....What make?.....or wooden stanchions?.....
10. How near to the stanchions in feet can the pump be placed?.....(Please locate on sketch)
11. Have you electric power?....If so, give Voltage....Phase....Cycle....
12. Have you a motor?....If so, state H. P....Speed....Size Pulley....
13. Have you a gas engine?....If so, state H. P....Speed....Size Pulley....
14. How many milker units will you require?.....(One man with 2 units can milk and strip 20-25 cows per hour.)

Name.....
P. O. Address.....State.....

Promoting The Purebred Industry

Suggestions For Selling "Bred-for-Production" Farm Animals

By L. H. ROBBINS

Livestock Editor, Wisconsin Agriculturist

PROMOTING the purebred industry—that sounds out of place to me. Promoting—indeed is a strange word to use in connection with a business that has always and should forever stand on its own merits. Promoting sounds like an oil salesman beginning to unload his stored up gas or hot air. Perhaps it means the ranking of the youngsters in the local school at the end of the school year, or possibly the real estate salesman broke into the orderly ranks of these livestock breeders.

There is an old saying, "You can't keep a good man down." It applies to livestock. If you will have patience for just a few minutes and clear your brain cells, making them ready for reason, I will try to point out a few reasons why we don't need to promote the purebred business.

Every breeder can remember the time when a number of men were running wild over these forty-eight states of ours. They carried every known device for promoting a good breeder's cash out of his own pocket into theirs. They were called breed journal fieldmen. They promoted purebred livestock from the front ranks of America's leading farms to the trenches of self-defense. To them, we owe the word "promote."

Efficiency Is Increased

The United States Department of Agriculture finds, after a most exhaustive survey, that the farmer who has purebred animals on his farm, is more than forty percent more efficient than the farmers who has common livestock. When one stops to think, those figures do not seem out of place. We all can recall the names of the "best" farmers in our neighborhood. There were the Hardings, the Lovejoys, the Gentrys, the Browns, the McKerrrows, the Bells, the Millers, the Barbers and a host of others whose homes directed the observer to prosperity, as a lantern guides a traveler in the darkness. As a carpenter is known by the tools with which he works, so is the farmer.

Almost without exception, the men who led in the development of livestock were breeders first, and sellers second. They have paid but little attention to the dissemination of their product. They may be compared to the inventor and creator, Edison, who invented and made the first talking machine, but not being a salesman, he has been content in seeing others merchandise his product. As Edison needed a salesman, so the breeder of purebred animals also needs a salesman, or he must become a better seller of his own product.

To have a product sell, it must have value. It must, in fact, be more valuable than similar kinds in general use. Is that true of purebred animals? Are they more valuable to the user than are the common kinds of farm animals? Let's see.

All the dairy cows in the United States produce on an average of 4,260 pounds of milk and 170 pounds of butterfat. They

returned their owners \$32 a head over cost of feed during 1923, according to J. C. McDowell, who has charge of cow-testing association work for the government. That same year all the purebred cows in all the cow testing associations of America produced on an average 7,422 pounds of milk, 293 pounds of butterfat and returned their owners \$72 over the cost of feed. In other words, the purebred dairy cows are 74.2 percent more efficient milkers, 72.4 percent more efficient butterfat producers and 125 percent better income payers. There are approximately 1,000,000 purebred dairy cows out of the total number of 24,675,000. Yet, the one million are 125 percent better income payers than are the other 23,675,000. These facts and figures are taken from average farm conditions. They are not comparisons of high class breeder's herds with common stock.

Costs More to Fatten "Dog" Steers

It takes 93 pounds more corn and 190 pounds more alfalfa to make 100 pounds of gain on common "dog" steers than it does on well-bred steers. In other words, it costs \$1.65 a hundred more to put the same amount of gain on the "dog" steers that it does on steers showing decided beef breed characteristics. These facts are shown in a comparative feeding trial at the Nebraska experiment station. The "dog" steers sold for an average of \$16.80 a head less than the good steers.

In 1913 a purebred beef sire demonstration was started at Grain Valley, Missouri, on the Sni-A-Bar ranch owned by Col. W. R. Nelson. An even 400 common red cows were purchased on the Kansas City Market. These cows were bred to good purebred Shorthorn bulls. Many of the cows had calves at their side, when purchased, sired by bulls of unknown breeding. The best of these calves were kept and fed out as two-year-olds. These two-year-olds, from sire of no breeding, out of the common red dams, sold in 1916 at from 60 cents to

\$2.25 a hundred-weight under the top for the days on which they were marketed. They brought from \$8.75 to \$25.00 per head less than top steers of the same weight would have returned.

Since that time many lots of first, second, and third cross steers, sired by good beef bulls, have been marketed. In only two cases have they failed to top the market 25 cents or more. On the average they have returned over \$13 per head more than the next highest cattle of the same weight sold on the same market at the same time.

Ton Litters Show Value

Over in Indiana, they started raising, by contest, ton litters of pork. A report of the Indiana Livestock Breeders' Association proves that there are real honest-to-goodness dollars to be made in using purebred hogs.

"The ton litters afford striking proof of the superiority of purebreds in producing market pork.

"Seventy of the 97 ton litters were purebred—both sire and dam of the same breed. Sixteen litters were crossbred sire of one breed and dam of another. Six litters were grade sire a purebred and out of a grade sow. Five litters were of mixed breeding, sired by a purebred boar and out of a sow of mixed breeding.

The pigs in the purebred ton litters averaged 214 pounds at six months, while the pigs in the crossbred litters averaged 213 pounds. Many folks think crossbreeding increases pork producing ability, but the ton litter work so far fails to show it.

"The pigs in the grade ton litters averaged 199 pounds at six months of age, fifteen pounds less per pig than the purebreds.

"The pigs in the mixed bred litters averaged only 186 pounds at six months of age, 28 pounds per pig less than the purebreds at the same age."

Only Part of the Story

These pork facts are farmer facts, for the results were secured on just average good Indiana farms. They show that, from a pork production viewpoint only, a litter of seven pigs from a purebred sow and sired by a purebred boar at six months of age is worth \$15.96 more than the same sired litter of the same age from a mixed-bred sow. There are figures at \$10 a hundred. Ask yourself, does it pay?

The "show me" stage brings out some striking facts about lambs sired by purebred and scrub rams. The average weight of the lambs—sired by the scrub ram, at three months of age—was 50 pounds. The same aged lambs, sired by a purebred ram, weighed 59.7 pounds. Both lots of lambs were out of common ewes.

You say, "That isn't much difference." True, it isn't much difference in weight, and to the average farmer would be scarcely noticeable. But—that is only a part of the story.

The lambs sired by the scrub ram sold

Standard Farm Paper Editorial Service

THIS is the fourth of a series of special articles by the members of the Standard Farm Paper Editorial Board. The members of this Editorial Board are as follows:

C. V. Gregory Prairie Farmer, Chicago, Ill.
D. A. Wallace The Farmer, St. Paul, Minn.
H. A. Wallace Wallace's Farmer, Des Moines, Iowa
Clarence Poe Progressive Farmer, Birmingham, Ala.
Donald Keefer Pacific Rural Press, San Francisco, Cal.
E. R. Eastman American Agriculturist, New York City
T. A. Leadley Nebraska Farmer, Lincoln, Neb.
John Cunningham Wisconsin Agriculturist, Racine, Wis.
A. J. Glover Hoard's Dairyman, Ft. Atkinson, Wis.

The author of the accompanying article is Livestock Editor of The Wisconsin Agriculturist, Racine, Wisconsin. He has had extended opportunity to observe the operation of the purebred livestock business, which, together with his unusually wide acquaintance among breeders, qualifies him to handle this important subject.

League Indorses Constructive Discussions

WE commend to every farmer and to everybody interested in the success of farming the following editorial taken from the February 24th issue of Dairymen's League News:

Two Kinds of Criticism

THERE are two kinds of criticism in this world,—constructive criticism and destructive criticism.

The former is based on facts and honestly aims to point out defects, at the same time suggesting remedies.

The latter is not based on facts and dishonestly aims to point out defects without suggesting remedies.

Constructive criticism is good for man or his organizations. It helps to build up; it stimulates or acts as a tonic. It is like the storm elements that beat against the growing oak and make it grow stronger and more beautiful. It is a part of the plan of healthful growth.

Destructive criticism does none of these things. It is like the insect or worm that bores into the growing oak and, unless eradicated, stunts its growth.

We welcome constructive criticism. It is legitimate. We shall forever fight destructive criticism. It is an outlaw.

We agree unqualifiedly and absolutely with the sentiments expressed in this editorial. It is a healthy sign when League farmers and their leaders welcome constructive suggestions and criticisms which are honestly and sincerely made. Farmers are coming rapidly to realize that co-operation is not a panacea or a cure-all, that a lot of mistakes are bound to be made and that progress can only be continued by carefully analyzing and discussing these mistakes that they and similar ones may not be made again.

However, we do not blame the League for representing a constant discussion of mistakes when the good work that the League has done is not also pointed out. The League is right when it claims that such discussions are destructive.

Recently at Farmers' Week at the New York State College of Agriculture, Mr. Fred H. Sexauer, a member of the Dairymen's League Executive Committee, gave an address on the League and the milk situation. We were not present at this meeting, but we are informed that at the close of his talk, Mr. Sexauer gave his audience an opportunity to ask questions about League matters, and the frank and full way in which he replied to all questions won the hearty approval and confidence of his audience. We are informed that one farmer asked Mr. Sexauer if he thought the article on the League by E. R. Eastman in

the February 7th issue of AMERICAN AGRICULTURIST was fair to the League. We are told that Mr. Sexauer replied to the effect that while he did not agree with Mr. Eastman on some of the points made, he thought the article as a whole was fair and constructive.

Men may disagree on as complicated a problem as that of organization and marketing milk, but if they are sincere and fair, the discussion will bring out all points of view; and if it is kept on a constructive basis, the resulting facts will tend to simplify and make easier the preplexing job of farm marketing.

A Good Scheme

ONE of the finest little plans of cooperation that we have read about in a long time is that described in Mr. Burritt's article on Page 282 of this issue, whereby the people of his school district cooperate in taking turns to furnish hot school lunches for the children in the rural school.

We have always had a lot of trouble with indigestion. Some of this probably is due to the fact of changing from a very active farm life to an office occupation and to eating too much in public restaurants. But we are firmly convinced that at least a part of it is also due to years of attending a district school as a child and eating cold, indigestible lunches. We have heard a great many other people say the same thing. The practice of carrying a sandwich, an egg and a piece of pie in a tin pail and setting it in the outside entry of the school room where it becomes overheated on warm days and frozen on cold ones is without question dangerous to the health of young children.

Therefore, the growing practice of many districts of doing something in the way of furnishing a hot lunch for the kiddies is highly commendable and the plan practiced in Mr. Burritt's district is the best one we have heard of yet. We have only one further suggestion and that is that every child should be provided with a small bottle of milk to be drunk in the middle of the forenoon every day.

Too Many Laws

WHAT are we going to do in this country about the overproduction of laws? In just one day in New York State Legislature recently there were 83 bills introduced. According to the National Industrial Council, there are 20,000 bills pending in the forty-eight state legislatures, to say nothing of Congress; and out of this grist there will be some four to 8,000 new laws. This is just one year's average.

The fifty-ninth Congress passed 30,000 bills and resolutions. The United States Chamber of Commerce is authority for the statement that Congress and the state legislature ten years ago passed about 62,000 laws in five years. At this time, except that the period was ten years instead of five, the British Parliament passed only 1500 laws. All of this does not take into consideration the vast amount of local legislation such as city and village ordinances.

The National Budget Committee states that there are more than two million laws now in force in the United States and that it takes 650 large volumes to hold in printed form the Supreme Court opinions on questions of constitutionality. The law library of Columbia University contains 100,000 volumes and increases at the rate of 8,000 volumes a year.

Nothing that we can say can add to the impressiveness of these figures. Is there any wonder that there is disregard for law in this country? We do not think it a radical statement to say that no state legislature nor even Congress should meet more than once in two years and then their session should be confined to a few weeks.

Use More Horse Labor

ONE of the chief reasons why the average farmer detests garden work is the fact that as the farm garden is usually handled, the work

American Agriculturist, March 14, 1925

is all done by hand labor and usually after supper and chores when the men folks are tired out. The answer to this is that the garden should be so planned that most of the work can be done with a horse and a good cultivator as a part of the regular day's work. In a village or city land is a real item and rows have to be planted close together; but this is not the case in the country. The rows should be wide and long with sufficient space on the ends so that a horse can turn around without destroying the crop.

Our Correct Address

WE note several subscribers are writing AMERICAN AGRICULTURIST to Elmira instead of to this office. Elmira is where the paper is printed and mailed but our editorial and business offices are located at 461 Fourth Avenue, New York City, and mail sent to this address will receive more prompt attention.

While we are on this subject, let us repeat again that we can pay no attention to unsigned letters or letters signed merely with initials. We will not print your name if you do not wish it, but we must know it is a matter of good faith.

League Cancellations

AS we go to press the League announces that the total number of cancellations of actual poolers is 1,768. We consider this number of cancellations an indication of the confidence of League farmers in their organization.

Increasing Consumption

IT IS said on good authority that thirty years from now THERE WILL BE ONE HUNDRED FIFTY MILLION PEOPLE IN THE UNITED STATES. There is not much doubt that this will be true; and it means a big increase in the demand of the products which the farmers raise. This one fact insures a moderate future success to the young farmer who is building his business on a common sense and businesslike basis.

Eastman's Chestnuts

AMONG my friends in Farm Bureau work is the tall, quiet-spoken chap by the name of L. A. Muckle, now of Niagara County. Mr. Muckle has been a county agent some years and is much respected and liked by the hundreds of farm people who know him and by his associates in Farm Bureau work who have elected him Chief Sod Buster.

Last summer when I was riding with one of these Sod Busters, across a western New York county, he told me the following story on Buster Muckle. It seems that the Farm Bureau men were holding a district conference and that Muckle drove to the conference in his flivver and parked it on a street where the parking limit was thirty minutes. Then he went to the conference and proceeded to forget about his car for the rest of the day.

When the conference was over in the late afternoon, he went up the street toward his car, and while some distance away, he saw a policeman tying a tag on. Farm Bureau men often get into difficulties where some rapid thinking must be done. And this was no exception. Deeply disturbed by visions of jail and fine, Buster Muckle halted before he got near his car and went into executive conference with himself. Then he turned around and went to the police station and reported his car stolen, requesting that search be made immediately for it! In a few moments, a cop came driving up with the battered old Farm Bureau flivver. Friend Muckle thanked him very profusely and climbed in his car and drove away!

Quotations Worth While

"He who gives a child a treat
Makes joy bells ring in Heaven's street,
He who gives a child a home,
Builds palaces for Kingdom come."
—MASEFIELD.

She Must Be A Good Mother

The One Great Quality That All Wives Must Have

By A. B. BORNT

THE responsibilities of life develop queer traits in some people, and one must be something more than a philosopher to figure out just what a girl will turn into as a woman. I should say that the greatest asset that any child can possibly have is a "good" mother.

Now by good, I mean just what Noah Webster means; his definition is, "The opposite of bad; wholesome; useful; fit; virtuous; valuable; benevolent; clever; adequate; valid; able to fill engagements; considerate; full or complete; and immaculate." Discover such a mother and a man would be safe to pick a wife almost at random from her flock.

I consider a good mother of more importance to a family and to the country at large than a good father. That may sound somewhat paradoxical, but give it a thought and bear me out. All nature turns its young over to the female of the species. Man is no exception. The first ten years of a child's life is unquestionably its mother's; and in that time she either "makes it, or breaks it body and soul." Both the present and the future then are in her keeping for the world belongs to the sons, not to the fathers.

I know a man, a disgrace to his Creator since infancy, who somehow married a good woman and has a family that any man could be proud of. The only qualities he possesses are "livableness" and "secrecy." When his family becomes old enough to find him out they will be too old to emulate him. They may pity or despise him, but the good habits and character instilled into them by their mother will carry them safely on.

This man realizes his worthlessness and his inability to change, and in fits of despondency, I have heard him curse his mother for not having brought him up in the way that he should go and making a man of him.

I, myself, have a habit contracted before I was ten that I have never been able to outlive. I shall take it with me to the grave and perhaps lose years of my life because of it. I blame no one for it; but it could have been prevented. Mind, I am not condoning any man's faults or his lack of honorableness, but simply trying to show that a good mother may have good children in spite of the father, and a bad mother bad children; for even a good man can hardly counteract the influence of an unfit mother.

To tease; to scold; to quarrel; to fight; to evade; to lie; to cheat; to whine, and to disobey, are qualities contracted from, and instilled into children, by their mothers; just as are the good qualities of neatness; fairness; cleanliness; truthfulness; obedience; respect; and a sweet and governed temper; together with the virtues of industry and home-making.

A father may take his sons out into the fields with him when older, and worry some manhood into them, and put the fear of God into them; and even win their respect and cause them to appear like unto men; but he can never chasten those little, mean, sordid,

hateful habits out of them, if they have learned them from their mother. And he will always have a heart overflowing with happiness and gratitude for them and the mother who has taught them well.

If I had to choose between a woman who,

when she is bent on having the last word, even if you take a club to her she will still kick while unconscious.

Do women know that men seldom marry the girl they are the most crazy about? Are they aware of the fact that good men look at a woman through the eyes of their unborn children, unconsciously perhaps, but still a vital factor in influencing their choice of a wife? This may not be true of those childless dwellers of the cities, but I am speaking of, and for, farmers' having been born and bred one.

I believe most men do not marry, a woman to displace the hired man, but, advocating equal rights, if a woman finds her happiness out-of-doors, it is fair to try to make other arrangements for a housekeeper. Some men marry for pure love and repent at leisure; others stick closer to the working necessities and realities of life and win to lasting happiness.

Some women look fancy and cook fancy; some are homely at the start but their looks and their cooking improve right along; I prefer the latter whether she be "Christian or Pagan." To sum the whole matter up, it is really the livable qualities of a person that make for the happy family. And I can conceive of no family being permanently happy without obedient, well-taught children.

We Thought for a Minute We Saw Signs of Old-fashioned Chivalry Returning —

But we must have been mistaken

Copyright 1925, New York Tribune, Inc.

DARLING in the New York Tribune

It Pays to Write Your Representative

IF you should go out and talk with some of your neighbor-farmers as I have been doing you would soon hear of a great number of things that are wrong in this world of ours. One of the most frequent complaints is that our representatives are doing what they want to regardless of the wishes of the people they are supposed to represent. We hear that manufacturers, financiers and politicians are running the people whom we have elected. I believe that to be nearly right but there are two sides to every question. The manufacturers and other people who are getting what they want from the representatives know that they can get it in only one way: Go get what you want yourself; no one is going to get it for you. That sums up one of the greatest troubles with us farmers. We expect too much from the other fellow. It is a lesson that we have yet to learn.

The farmers everywhere have the general idea that it would be useless to write any official. I believe that there is no basis for this belief. The fact that officials do read our letters is shown by Gov. Smith's reply to the reader of AMERICAN AGRICULTURIST who sent his tax reduction on petition directly to the Governor.

I will compare an official to a hired man.

We advertise for a man to work a farm. From the list of applicants we select one who seems to be competent and ambitious. We, when we hire him, believe that he intends to fulfill any promise he has made.

On the farm he does well. He is up at 4:30, has the milk at the creamery before our neighbors, the chores are done and he is ready for the field before the dew is off. We are satisfied so we don't say much to him. He thinks

FERTILIZERS

"The World's Best
by Every Test"

FOODS

It is a duty to provide good wholesome food for one's family and economy to furnish good nutritious food for one's stock. It is equally important to feed one's crops with the best plant foods, prepared in such forms and condition as to be readily available to the tender plant rootlets. The best plant foods are more carefully selected and more scientifically prepared and compounded than foods for man or beast.

"AA QUALITY" FERTILIZERS

comprise all the essential factors of the best plant foods that practical experience and scientific research of over half a century have developed.

To insure the largest yield and best quality of all crops use

More About Acid Phosphate, "Phosphates" and Acid Soil

I would like to know if you could give me any information concerning the use of acid phosphate. I have been using high grade phosphate but have been informed that acid phosphate will answer the same purpose and do the soil no harm. Now as I understand it, we use lime to destroy acid in the ground or otherwise sweeten the soil. Is the acid in the soil the same as that contained in acid phosphate? Any information concerning the use of acid phosphate with lime will be much appreciated.—J. E. B., New York.

THERE is a great deal of misapprehension about "acid phosphate," particularly on account of the use of the word "acid." It is quite natural that farmers who are unacquainted with the substance would immediately associate acid phosphate with acid in the soil. As a matter of fact, acid phosphate does not create an acid soil any more than a regular fertilizer. As evidence of this it is well to read carefully Jay Gelder's article on alfalfa in this issue on page 274. Mr. Gelder points out that an application of acid phosphate increased the yield of alfalfa above the check plot that received no application. We all know that alfalfa is a lime loving plant. Had acid phosphate created an acid condition in the soil it surely would not have been responsible for an increase in the yield.

As a matter of fact as was pointed out in AMERICAN AGRICULTURIST of February 7, specific experiments have been conducted which showed that in some cases the actual lime requirement was slightly less after acid phosphate had been applied over a period of years.

How It Gets Its Name

The way acid phosphate gets its name is due to the fact that the raw phosphate rock is treated with sulphuric acid to make the phosphate in the rock more soluble and more readily available to the feeding roots of the plants.

There is no question about the value of phosphate in the life of plants. Without it seed would fail to develop and plants would fail to mature properly. There is lots of phosphate in the soil but it is in such a form that plants cannot get at it. Therefore we must furnish the phosphate in some available form that the little roots may take it up without much effort.

Answering this question, therefore, acid phosphate will not hurt the soil or the crop. On the other hand it is a decided benefit. Just how much to use depends upon the crop in question. In his bulletin on improving old pastures, F. I. Montgomery says "Lime and acid phosphate must be applied to probably three-fourths of the old pasture lands before a good permanent grass sod can be expected. Lyman Carrier has shown that in his Virginia experiments that an application of 700 pounds of 16% acid phosphate increased the yield of five cuttings of alfalfa a total of 2208 pounds per acre. L. A. Dalton of New York points out that tests show that acid phosphate is the most economical source of phosphorus for New York farmers. "The amount will vary," he says, "but in general from 200 to 500 pounds to the acre is sufficient." Use of "Phosphate as a Word Sometimes Confusing.

Use of "Phosphate" is a Word Sometimes Confusing

J. E. B. has confused two names in his question, namely acid phosphate and high grade phosphate. Undoubtedly by high grade phosphate he means a high grade fertilizer. There two cannot be compared unless the specific crop is taken into consideration. A high grade fertilizer contains three very essential plant foods: nitrogen, phosphorus and potassium or potash. Acid phosphate only contains phosphorus. In some sections a complete fertilizer containing nitrogen, phosphorus and potash is improperly called phosphate, which is responsible for this readers confusion, no doubt.

Some crops need a complete fertilizer that carries nitrogen, phosphate and pot-

Drilling for Money

Most farm profits are machine-made. The first-class grain drill is a consistent contributor to the farmer's income as measured in time and seed saved, and in the increased size and improved quality of his crop.

John Deere-Van Brunt Grain and Fertilizer Drill

insures uniform planting of seed and even distribution of fertilizer—without bunching, without skips and without firing.

The Van Brunt Adjustable Gate Force-Feeds compel a steady flow of seed, the same amount from every feed. Every seed is protected until it reaches the bottom of the furrow; every seed is properly covered by chain covers. Even growth—no bare spots—more bushels per acre.

Write today for literature. Address John Deere, Moline, Ill., and ask for Booklet HF-63

HARDY Ensilage Seed Corn

Get your Ensilage Seed Corn from reliable growers in the famous West Branch Valley of Northern Pennsylvania. Every field producing this Corn was thoroughly inspected by disinterested representatives of Pennsylvania State College, and Cornell University. We have only a limited supply of good seed this year. All thoroughly air-dried, graded and shipped in new bags.

Write us for samples, prices and complete description. Order direct from growers and be safe.

How We Use Our Bank

Few of Us Realize How Many Ways It Can Help

IN the business of farming, when it comes to any question of finance, either out-go or income, we farmers sometimes find ourselves literally "not in it" with those with whom we must deal. At the same time, what Liberty H. Bailey, warm friend of the farmer, long ago said, is dead-sure true:

By David Stone Kelsey

at least once a year, would be worth

face value in a few minutes in case of loss by fire, and must be kept outside the building therefore, for which purpose all banks now have safety vault boxes for a trifling annual rent.

Suppose you are thus paying \$5 rent per year. How much "advice" could one get from the average attorney for that small fee? On the other hand, your banker stands ready to give you information or other service, for no charge whatever. You are entering into some form of agreement, or limited partnership with another farmer—the joint ownership of some valuable breeding animal or new machine. Or you are transferring your share in some such personal property—buying or selling it, and wish to make sure it is legal.

What do you know about such? But your banker does—or will look it all up for you, and warmly appreciate your confidence in him.

An Aid in Marketing

If one is marketing stuff at a distance, the bank is the easiest and safest medium through which to either pay or collect. This will be read with surprise by thousands, for the average farmer is not used to so dealing, but let him learn business methods from business men, and his own business will immediately benefit. And finally if there is no bank in your town or market-place, that may be your fault. That place lacks the first requisite of trading and business success. Get together gentlemen. Pool your savings and start one—for the good of your community, if for no other reason. And by the same rule, if you have a bank—probably merely struggling along, patronize it. Deposit your cash there and pay by check, always, and keep your papers in its vaults. Many mickles make a muckle, and community uses for idle funds will promptly react to your own advantage and further prosperity.

It is more than likely that some of the terms here used have sounded strange. Plenty of otherwise good farmer-business men do not know the significance of such terms as sight-draft, bill-of-lading, bonded receipt, acceptances, etc., and I strongly recommend that all such take measures to learn of these things by the early use of some good special manual on business. Much foolishness might be avoided if we "independent farmers" would take our bank and banker more into confidence.

First Resort for Advice

Matters of rural law, the execution of conveyances, leases, crop-rights, water-rights and trespass rights; the fence laws, drainage laws, highway laws, rights of side-paths, shade trees and roadside poles, roadside fences, bounds and frontage rights; warranties upon the sale of horses or other animals, the matter of liens, rents, and chattel-mortgages; donations, gifts and wills; employer's liability, due-bills, power of attorney, what constitutes usury, rights of pensioners and tax-exemptions—a thousand such terms and questions are any moment liable to confront the live farmer in such a manner as to make it a matter of many good dollars—whether he understands or does not feel strong upon that particular subject. With us, in every such case, the bank and banker are our first resort. Only upon their advice should we, as a rule, take any minor matter to an attorney, and not more than once or twice in a decade, to actual legal action. If we are in the wrong, we settle; if in the right—we forget it! I have found one could make \$50 with the time and energy that would be spent in "collecting" \$5.

D. S. KELSEY person who is not a good business man cannot be a good farmer.

We have found that, more than an attorney, or any other business associate, our banker will always freely give the benefit of his wider, fuller experience in any of our financial matters. Our success, our prosperity, is his, and his wisdom is ours—for the asking and always without charge. He only asks that we be entirely unreserved and frank. He must know all about our business affairs, to give sound advice, and I for one always answer his every question fully and frankly.

Especially if we discount a note, I let him feel assured that we know exactly where and when the money to meet that note is coming from—whether it be in two or four months, or more likely, in twice four months. You will not secure a loan for more than four months, usually, but if the procedure glimpsed above has been followed, there should be no trouble in "renewing" a four months' note in full, once, or even twice. It is easy to show a banker that a farmer's capital cannot be turned over in much less than one year. The average is nearer eighteen months.

In all this, the essential thing is to let your banker see that you yourself understand your own business thoroughly, and that you have confidence in it. Thus armed, in going to your bank, you can talk intelligently.

Your Confidence Means Much

Quicker than we, he understands the difference between borrowing for past debts, for present improvements and for future profit. In the latter class are such items as seeds, plants, fertilizers, investments in new breeding animals and even nursery stock. In the second come machinery, new buildings and repairs on old ones. All these last named are legitimate subjects for temporary borrowing, but look out for the dead items first mentioned, the "past debts." Take care of them without borrowing if you possibly can. This chat aims to make such a condition unnecessary, and should do so, except under stress of something unforeseen. Another use of the bank is as a safe place for valuables. In these days of county banks everywhere, and excellent roads, there is no excuse for hoarding money or exposing other easily portable valuables not in present use. All negotiable papers are particularly exposed to theft, and of course a total loss in case of fire. Liberty Loan or other bonds or stocks, promissory notes, mortgage deeds and notes accompanying, and any and all forms of contracts, including deeds, insurance papers, and an entire itemized inventory of the contents of each building—these, corrected to date

Red-lead helps man win the greatest war of all time

THIS war is between man and Nature. What man builds, the forces of Nature try to destroy. Nature is everlastingly striving to return all materials to their original and most stable form.

Man uses in his structures, among other materials, the strongest metal he has—steel. Opposed to it is one of Nature's strongest elements—moisture-laden air. The air attacks this metal which man has won from Nature and tries, by what is known as rusting, to draw it back to its original state. If the metal is left to face the attack alone, it soon weakens. It crumbles—is destroyed.

This battle with rust goes on about your own farm every minute of the day. You have steel in metal equipment, machinery, plows, metal gutters, various farm implements.

With red-lead, made from the metal, lead, you can make a covering for your steel through which air and moisture cannot penetrate. With red-lead your steel and thus your farm equipment give much longer service. When you give your metal this complete protection, you do only what engineers, building contractors, railroads, steamship companies and the U. S. Navy do for all the steel they use.

Follow their example further and use Dutch Boy red-lead.

Dutch Boy red-lead is pure and is highly oxidized. It has stood all tests for durability. It makes a hard, tenacious film that is still elastic

enough to expand and contract under heat and cold without cracking. Because it is exceedingly fine, it brushes out evenly and has unusual covering power. It gives full and economical protection to the metal surface it covers.

Dutch Boy red-lead, ready for mixing with pure linseed oil, comes in the natural red-lead color. It can be shaded to browns, greens, black, and other dark colors as desired.

Free paint booklet

We shall be pleased to send you a booklet, "The Handy Book on Painting," a storehouse of general paint facts and formulas. A section is devoted to the protection of metal surfaces. It tells how to prepare the surface for painting, how to mix and apply the paint. We shall also be glad to give you any specific information on any particular painting problem you may have.

Other Dutch Boy Products

In the famous Dutch Boy series of products, besides red-lead, there are white-lead, flattening oil, solder, linseed oil and babbitt metals.

National Lead Company, in addition, makes lead products for practically every purpose to which

lead can be put in art, industry and daily life. If you desire specific information about any uses of lead or have any special paint problem, write to our nearest branch.

Save the surface and you save all—Dutch Boy Red Lead

How I Start Alfalfa

It Can Be Done, But How Many Will?

By JAY GELDER

WE had been discussing grass seed in general and the high price of red clover in particular.

"I am going to sow alfalfa next summer," said a farmer who lives in the vicinity of Cincinnatus, N. Y. "What variety of seed would you recommend?"

"That's fine" says I, and mighty sensible. Regarding seed, the Ontario Varigated seems to be giving good results in this section but I would prefer at least half Grimm. Grimm alfalfa stands grief. If fifteen pounds per acre are used and the common mostly dies, by the end of the second or third winter, the Grimm will have stood enough by that time to leave a good stand.

"Do you need lime?" I asked. "Oh! Yes we need lime. I buy the best I can get. It cost me \$17 per ton," he replied.

"Does your Farm Bureau Manager recommend using \$17 lime?"

"Don't know. Don't want anything to do with the Farm Bureau."

"But I believe your Farm Bureau

permit. We find it best to apply two

tons ground lime rock per acre as soon as convenient, preferably not later than May, also 800 to 1000 pounds 16% acid phosphate per acre preferably about 10 days before seeding. It will pay to treat seed with alfalfa culture. This culture material may be secured through local Farm Bureau or order direct from State agricultural college. We sow anywhere from July 1st, to 15th, preferably as soon as the ground can be worked after a heavy shower, using 10 to 15 pounds seed per acre, the later if sown broadcast or with wheelbarrow seeder. It is a good idea to sow one-half the seed one way of the field and cross with the other half.

No matter how big the growth do not cut until the following summer.

The other method consists in selecting good strong ground free from quack, mustard or kale. Sod ground that has been well manured, plowed and planted to corn or potatoes in 1924, if well drained, should be O. K. Apply lime and acid phosphate as in method previously described. Sow as early in spring as ground can be worked. Early seeding is *very important*. Weed seeds are dormant and the alfalfa stands at least an equal show.

By this method a good cutting of one ton or more per acre can be had usually in July, which will about pay the expense of seeding. We have found a top dressing of coarse manure during early winter pays big.

Dr. Clarke of Essex, N. Y., used 500 pounds acid phosphate as a top dressing on alfalfa sod. A ten acre field on the Clark farm so treated produced approximately five tons of alfalfa per acre seven years after seeding.

F. L. Porter of Crown Point, N. Y., grows over 300 tons alfalfa per year. He reports good results from using 500 pounds acid phosphate per acre as top dressing for alfalfa meadows.

Based on actual experience the writer believes alfalfa can be successfully grown on some parts of 90% of New York State farms. Properly cut and cured it has a feeding value for most stock about equal to bran, or two or three times greater per ton than timothy. About 40% of the alfalfa growth is under ground. The great root system and ability of the plant to take nitrogen from the air, enriches the soil as does no other crop.

Good alfalfa forage and rich ensilage is practically a balanced ration for milch cows or growing stock and will reduce the high priced grain ration enormously. Of course we are all going to try a small piece of alfalfa, or top dressing the piece we now have, but we wonder how many will. Regrets pay no dividends.

This is an exhibit that was made by the Essex County Farm Bureau. It shows comparative yields of alfalfa under various treatments. On the left the first bundle shows the effect of an application of acid phosphate and lime. The second bundle from the left represents an application of 2 tons of lime per acre. The third bundle from the left shows an application of acid phosphate alone, 800 pounds per acre. On the extreme right, the small bundle shows where no fertilizing was practiced.

manager would recommend a high grade finely pulverized lime at about a third of the price you are paying delivered, which would mean a big saving to you."

"Well, I don't know. But they tell me this \$17 lime is the best and I am going to use it."

Just who advised \$17 lime was not clear, but it was clear that my farmer friend, like many of the rest of us, would rather be stubborn than prosperous. The writer has successfully and quite extensively grown alfalfa in Steuben, Warren, Washington, Saratoga and Essex Counties during the past 20 years.

Two methods have been used. One was to select good corn or clover ground to plow in fall or early spring, harrow once a week or oftener if necessary, to keep weeds or quack from showing the least bit green. In dry time we harrowed as soon after a rain as the ground would

Alfalfa on the farm of F. L. Porter, Crown Point, N. Y. This field was summer fallowed and sown July 1922. The photo shows the first cutting which was made on June 10, 1923. The method of sowing is that first described by Mr. Gelder on this page.

THE Long Island Cauliflower Growers Association, which has its headquarters at Riverhead, L. I., held its annual meeting on February 28 at which time the annual reports were read, showing a very successful year's business. The association did a total business of over \$300,000 in 1924 and paid a 20% dividend to the stock holders. The association has a surplus of over \$2,300 on hand and has net assets of over \$62,000 with all debts paid. This business was done on a capital of less than \$6,000 and at a cost of operation of slightly under \$9,000. Up to this year, the largest dividend previously paid amounted to 10%. There is no question but what there are very few farmer co-operation associations that can point to such a remarkable achievement.

Big Turnover in 1924

During 1924 the association sold approximately 134,000 packages of cauliflower at auction, over 108,000 of which were sent to New York City. Cauliflower was also marketed in Chicago, Philadelphia, Cleveland and other large cities. The association maintains an auction at Riverhead and through this their crop is merchandized as the market needs it and dumping and surplus is avoided. Of course, last fall early freezing weather cut the shipping season short by at least two weeks so that their business was even less than it would have been had favorable weather prevailed.

In addition to selling cabbage, the association does a large business in selling cauliflower seed. Last year approximately 9,000 ounces of seed were sold.

Organized Almost Quarter Century Ago

The association was organized almost a quarter of a century ago. At that time it was felt that by doing business co-operatively they could save on freight rates by making bulk shipments. The auction was developed which so operates that the crop is moving into New York and other markets as the demand justifies. Seldom if ever do we hear of a glut of Long Island cauliflower. Much of the success of the association is due to the clever management of the association's business by D. C. Corwin of Riverhead, who is general manager. Charles H. Aldridge has been president ever since the organization of the cooperative. This year, however, he resigned in view of the fact that he is no longer a resident of Suffolk County.

Directors Elected

At the election of the stockholders the following directors were elected: E. E. Boisseau, Southold; George Smith, Peconic; Edmund R. Lupton, Cutchogue; Charles J. McNulty, Laurel; Herbert R. Conkling, Mattituck; Frank W. Luce, Jamesport; John R. Reeve, Aquebogue; Henry A. Talmage, Riverhead; J. Septer Edwards, Calverton, and John Raynor, Manorville.

Frank R. Luce of Jamesport is treasurer of the association. In his report he stated that total receipts for 1924 amounted to \$328,584.98.

It is something like 50 years ago that cauliflower growing first became a distinct industry on the East End of Long Island. It is said that John W. Duryee of Mattituck was the first farmer to grow cauliflower in a commercial way. Gradually he got other farmers interested in it and from then on it has been grown extensively. Not all of the cauliflower on the East End of the Island is handled by the association. However the bulk of it is so merchandized.

There was a time, it is said, when the township of Southold and Riverhead grew more cauliflower than all the rest of the United States put together. However, other sections have taken up the project and now there are many sections producing it in a commercial way.

"GOOD EQUIPMENT MAKES A GOOD FARMER BETTER"

Put Richness Back in the Soil!

ALL men who have made good money at farming have been very careful to keep their soil fertile and rich. There are poor years and good years in farming but the man who puts manure on his fields in the right way will reap real profits.

The McCormick-Deering Manure Spreader is one of the most valuable machines on the farm. It increases yields, pays for itself in a hurry and goes on building bank accounts.

It spreads smoothly and evenly, putting on just as light or as heavy a coat as you want. The pitchfork method of spreading cannot equal the yields that follow the McCormick-Deering. That has been proved many times. Besides hand spreading is hard work; the McCormick-Deering saves many hours of time and much hard labor. Its good strong beaters tear the manure rapidly and spread it well beyond the wheels.

9. Positive Apron Drive.

Built in two sizes to fit small or large farms. See the spreader and its practical features at the store of your McCormick-Deering dealer.

Additional Long Island Farm News

D. T. HENDRICKSON

TREASURER John L. Havens of the Suffolk county agricultural fair association reports that the 1924 exhibition showed total receipts of \$39,534.26, with expenses including permanent improvements of \$36,494.38, leaving a balance at the end of the year of \$3,039.88. The fair is held under the management of the Suffolk county agricultural society, of which Henry S. Bush is president. The other officers for the ensuing year are: Vice-president, Nathan H. Dayton; secretary, Harry Lee; treasurer, John L. Havens; board of managers, Messrs. Havens and Lee and Edward H. Albertson. The dates for the next county fair are September 22, 23, 24, 25 and 26, which is the week preceeding the Mineola Fair held in Nassau County.

R. C. Parker of the Federal land bank at Springfield, Mass., has been making frequent trips among the farmers of the Island recently planning a campaign which will point out the advantages of obtaining

loans from this bank. However, borrowing money in this manner does not seem to appeal very strongly to the conservative farmers, who have enjoyed local banking accommodations for many years. The Long Island branch of the association has loaned but \$33,000. This branch has chosen the following officials: President, Charles E. Hedges; vice-president, Mrs. Annia E. Thurm; secretary and treasurer, Charles G. Smith. The above, with Charles T. Shaw, compose the loan committee.

Long Island potatoes are now selling for 90 cents a bushel, F.O.B., an increase of ten cents per bushel within the past fortnight. There are still large quantities of potatoes in storage, the growers expecting a price of \$1 before spring.

A crop that is being grown extensively on the island is that of cucumbers for pickles. The chief growers at a meeting in Speonk discussed such matters as grading, varieties, and transportation. This season, the cukes will be graded into three sizes: large green cucumbers pickles from three to five inches long, and culls or nob. The contract price is

\$5.50 per thousand for the first two classes and 40 cents per bushel for nob. As to varieties, most of the growers seem to favor improved White Spine instead of Boston or Chicago pickling. Transportation will be by motor truck. Tomato growers are also entering into contracts with the pickling houses to furnish them with green tomatoes at 50 cents a bushel, F.O.B., basket also furnished by purchaser.

There are 8,400 dairy cattle in Suffolk county and only a comparatively few of these have ever been tested for tuberculosis. There is now a movement on foot to have the cattle tested. D. W. Kelsey, manager of the county farm bureau, heads a committee that will try to obtain signatures of at least 90 per cent. of the owners of cows to have them tested.

The Apple Market

Late Winter Observations by a Man Who Knows

Readers of AMERICAN AGRICULTURIST By HERSCHEL H. JONES

will recall Mr. Jones as a former writer of the market reports appearing in AMERICAN AGRICULTURIST. As a former Director of the New York City office of the New York State Department of Farms and Markets, and now head of the Herschel Jones Marketing Service, Mr. Jones has had the opportunity to come into the most intimate contact with the apple business. Through the contacts that he has established in the business, he has made himself one of the best informed men on the subject. His article that follows on his observations on the apple market during the past few months should prove most interesting and helpful to our fruit growers.

IN the last half of February the apple market has shown a weaker tendency. This was due to several factors of which the most important are:

- (1) heavier consignments from storage holdings outside New York City, particularly of poor quality stock that had to be moved.
- (2) reduced consumption resulting from high prices, competition of grape fruit and other fruits, and warmer weather.

F.O.B. buying of barreled apples was practically at a standstill in February except for limited purchases of Ben Davis A-grade 2 1/4-inch up for Scandinavian markets. For several weeks the prices realized for apples on the other side were very nearly the same as growers and shippers were asking for the same apples f.o.b. shipping point in this country. Heavy cargoes of western boxed apples arriving in Europe in January were greatly in excess of the consumptive capacity of some of the smaller ports. An over-supply of oranges also affected the price of apples. An epidemic of influenza in England led the citrus fruit people to ship large supplies there, for which the expected demand did not materialize.

Export Demand at Low Ebb

Another factor in the export situation is the fact that dealers on the other side bought heavily early in the season on an f.o.b. shipping point United States, or F. A. S. New York basis and in many cases did not realize on their investment. Quantities of these apples bought at relatively high prices were held in English ports by the receivers in an effort to avoid loss. Then also several exporters were holding large stocks of both barreled and boxed apples on this side which they wanted to clean up in January and February.

The export market on March 1st is not in a strong position although prices for first quality barreled and boxed apples in a number of markets abroad have recovered from the slump. Nova Scotia is now about finished shipping. Most of the export sizes of boxed and barreled apples have been shipped. But Tasmanian apples are expected in England about April first and reports are that consumption has fallen off quite generally abroad.

Probably the most striking development of the export market this season has been the high prices secured for Ben Davis. Starting even before September 1st there was an active inquiry from foreign markets for Ben Davis. This much maligned apple has shown many of the more aristocratic varieties a thing or two this season. Its qualities of durability, as well as bright color, are quite an asset for long distance shipping. The earliest de-

mand was from South America and West Indies. Virginia shipped thousands of barrels this year before the apples were mature enough to have any color or to be fit to eat, according to our domestic standards. It is extraordinary the quantity of Bens absorbed by the South American trade when you consider that it cost nearly \$4.00 per barrel to ship them down there and this on top of f.o.b. Virginia prices of \$2.75 to \$3.25 plus freight, handling costs at New York and profit for the exporter.

South American vs. European Demand

This South American trade is mostly over before December 1st and the demand there is for a 2 1/2 inch up pack, or larger sizes. The European demand, however, is far smaller size fruit, or 2 1/4 inch up pack. The grower who gets his Bens on the Market early should separate the A-grade 2 1/4 inch from the 2 1/2 inch up. I would recommend going further and making three sizes of A-Grade: 2 1/4 inch, 2 1/2 up to 3 inch, and 3 inch up. For later markets I would recommend packing the A grade in two sizes: 2 1/4 inch up to 3 inch, and 3 inch up.

Since the middle of January Ben Davis have sold as high as \$5.75 to \$6.00 per barrel delivered steamer New York, though probably the bulk of the sales for export were at prices equivalent to \$5.45 to \$5.75 delivered steamer. This means a range of from \$5.00 to \$5.50 per barrel, f.o.b. western New York. Some shippers still expect to get \$6.00 per barrel for their Bens but there is nothing to indicate that such a price will be realized, as far as the experienced exporters can see.

Greenings Meet Good Demand

An interesting feature of the domestic market this season has been the continued strong demand for Greenings. The New York public is sold on the Greening as a cooking apple. Probably many growers do not realize that the Greening is the only Eastern barreled apple that goes into a large portion of the fancy retail grocery stores in the most expensive neighborhoods. Such stores will pay fancy prices for large size Greenings, preferably 3 inch up. The wholesale price of A grade 3 inch Greenings has ranged between \$7.50 and \$9.50 per barrel for three months and some fancy stock has gone higher. It pays to grow large size Greenings and to pack the A grade in three sizes of 2 1/4 inch, 2 1/2 and 2 3/4, and 3 inch up. The A 2 1/4 inch go well for export. The B grade should be picked 2 1/4 and 2 1/2 inch up.

The wholesale apple trade does not look for further advances in the market now except on fancy large green apples such as Albemarle Pippins, and other apples suitable for baking. The Albemarles are showing a lot of scald and few of them held in storage now are in condition to keep late. Large Baldwins of high color are scarce, and the 2 1/2 inch up packs will probably hold steady for fancy fruit, but it is generally believed that average quality stock will decline rather than advance.

"Hope springs eternal."—JUDGE.

What Readers Want to Know

THE question "does it pay to use fertilizer" is a very broad one. Taking I would like your opinion on fertilizer. Does it pay to use fertilizer? A salesman is coming through this section getting orders. We never used it but some of the things he tells us leads us to believe we will profit by its use.—N. J. W., New York.

our average conditions in this territory into consideration, a blanket answer would be "Yes, by all means". However, your local soil conditions and the crops you raise will determine what kind of fertilizer and how much you should use. You have not mentioned this in your letter and therefore we can give you no definite information relative to your specific problem.

Consult Your Farm Bureau Man

There is only one man we know of who can give you the desired information and that is your county agricultural agent or farm bureau manager. He can go over the specific field in question and recommend what your crop and soil practice should be taking into consideration the crops you have raised on this piece of land and the crops you contemplate raising.

If you are growing cash crops there is no question but what your returns will be bettered by the application of a high-grade fertilizer. As was mentioned previously how much to apply depends on the kind of soil you have, how it lies and the crop you are raising.

Use High Grade Materials

In purchasing your fertilizer, make sure that you are getting a high grade material. Do not feel satisfied with an analysis of 2-8-2 or something similar. Reliable fertilizer companies are putting out what is known as the high grade fertilizers that carry more plant food and less filler.

If you are contemplating fertilizing a meadow or a piece of alfalfa or clover, it may be more profitable and undoubtedly will be, to apply agricultural lime either in the form of ground limestone or hydrate and 16% acid phosphate.

This Inquiry Was Only Signed With Initials

This request for information was received unsigned. It is only occasionally that an unsigned letter is read. In this instance we felt the circumstances prompted immediate publication. Furthermore, it is a question that we believe others are interested in, and so it was inserted in the first available issue. However, had the inquirer for information signed his full name, the answer to his question would have reached him over a week ago.

Remember, the standing rule is that all unsigned mail shall be consigned to the waste basket. Putting your name on the envelope is not enough. Your name will not be used if you so desire it, we will not even use your initials. All inquiries are answered by individual letters. Only a very small percentage being used in the columns of American Agriculturist—those that have a general appeal.

* * *

Top-Working Wealthies

Is it practical to top-work two to five-year old Wealthy apples to other varieties?

It could be done, yes, but the Wealthy is not a very vigorous grower especially in later life and probably wouldn't make the best stock. I would consider it doubtful practice.

* * *

Is it advisable to dehorn trees where the apples grow beyond reach?

Yes, if the trees are not too old and high. Trees in good vigor that have plenty of room to spread out and good bearing surfaces lower down it will probably pay to dehorn; with very old high trees lacking lower branches and having branches of large girth it is a questionable practice.

Try this at our expense—

Let us send you, free,
enough Arcadian Sulphate to
fertilize 25 sq. ft. of soil!

TRY before you buy! Here's your chance to test out Arcadian Sulphate of Ammonia on your own soil. We're ready to send you, free, enough Arcadian to fertilize 25 sq. ft. of soil.

You'll find Arcadian Sulphate a fast worker. Contains one-third more ammonia (one-third more active plant food) than any other nitrogenous top-dressing. Fine and dry and easy to spread. Apply the sample as directed and check up on the results. Send in the coupon today.

Helpful bulletins—also free

When writing for your sample, mention what crop (or crops) you raise. We'll send you free bulletins telling you how to increase those crops. The bulletins are the work of noted authorities—they're brimful of sound information for farmers, vegetable growers and fruit growers. Send the coupon in today to our nearest office for sample and bulletins.

Depraved Appetite and How It Is Treated

I have a calf seven months old that does not want to eat anything. She is getting very poor but seems to feel good. She chews boards all the time. Please give me the cause and what to do for her.

—W. D. F., New York

UNDOUBTEDLY your calf is suffering from what is known as depraved appetite. The following is copied from a volume put out by the U. S. Department of Agriculture on diseases of cattle, which will, we are sure enlighten you on this subject.

"Cattle suffering from this disease have a capricious and variable appetite as regards their ordinary food, but evince a strong desire to lick and eat substances for which healthy cattle show no inclination. Alkaline and saline-tasting substances are especially attractive to cattle having a depraved appetite, and they frequently lick lime, earth, coal, gravel and even the dung of other cattle. Cows in calf and young cattle are especially liable to develop these symptoms. Animals affected in this way lose condition, their coat is staring, gait slow, and small vesicles containing yellow liquid from under the tongue; the milk given by such cows is thin and watery. Such animals become restless and uneasy, as is indicated by frequent bellowing. The disease may last for months, the animal ultimately dying emaciated and exhausted. Depraved appetite frequently precedes the condition in which the bones of cattle become brittle and fracture easily, which is known as osteomalacia.

What Causes the Condition

"It is generally believed, from the fact that this disease is largely one of regions, that some condition of the soil and water and of the local vegetation is responsible for it. It is more prevalent some years than others and is most common in old countries, where the soil is more or less depleted. Cattle pastured on low, swampy land become predisposed to it. It occasionally happens, however, that one individual in a herd suffers though all are fed alike; in such cases the disease must arise from an imperfect assimilation by the affected animal of the nutritive elements of the food which is supplied to it.

How It Is Treated

"The aim in such cases must be to improve the process of digestion and to supply the animal with a sufficiency of sound and wholesome food. The following should be given to the cow three times a day, a heaped tablespoonful constituting a dose; Carbonate of iron, 4 ounces; finely ground bone or "bone flour," 1 pound; powdered gentian, 4 ounces; common salt, 8 ounces; powdered fenugreek, 4 ounces; mix. In addition to this, 3 tablespoonfuls of powdered charcoal, may be mixed with the animal's food three times a day, and a piece of rock salt should be placed where the animal can lick it at will. German veterinarians have had brilliant results from the treatment of this disease with subcutaneous injections of apomorphine in doses of 1½ to 5 grains daily for three or four days."

Giving Salt to Cows

Which is the better—to mix a definite amount of salt in the feed ration for the milking cows or to always have salt before them in a box or trough or on their hay? —L. H. H., New York.

About the most desirable way to give your cows salt is to mix it in the dairy ration. If you are buying commercially mixed feed of good quality undoubtedly your salt problem is taken care of. If you are mixing your feed about one per cent of the total weight of the mixture should consist of salt, in other words 99 pounds of feed plus one pound of salt.

It is all right to have salt in a trough

but the trouble is that half the time the salt box is empty and when the herdsman thinks of it, the cows go at it too strongly and overdo the matter. There is no particular harm in having a salt box in addition to salt in the ration, providing of course that the ration is well balanced, complete and satisfying. If a ration is "off," either as to the constituents or its palatability the craving for salt may be excessive and under those conditions they may get too much salt if they have access to it in a box. It does not seem advisable to put salt on the hay.

We Learn How To Cooperate By Experience

WE have many real authorities on co-operation. These doubtless will be better authorities when they have had more experience and time to study co-operation. Already much is known but not by any means all. Many of the men who we consider wise in the line do not agree as to the best form of organization to be employed. Come to think of it that is not strange and it is probably fortunate. Because people differ it follows that the different forms will be the more carefully studied and the faults and benefits of the various associations will come to be better understood.

About the best statement that I have heard about the matter was by a very good authority who said that all the forms of organization have succeeded and about every sort has failed. Much depends on the management, the locality and perhaps on the commodity. No form should be assailed simply because it does not line up with one's preconceived ideas. It may be best under the circumstances of its origin and operation. That does not mean that it may not be changed sometime when different circumstances demand it or the outlook is clearer for a different form.

Early Ideas Changed

Much has been said about the form of the Dairyman's League Association. Its form has been criticised by many. It does not follow that a change ought to be made in its organization, nor does it follow that no change should be made because some think that it is good enough as it is. All that we can say is that there is no objection to a careful study of it and its operation as an organization. Perhaps some changes may be made to advantage. If that should finally come to be recognized it is no criticism on the form adopted when it went into effect for we have every reason to think that every step was studied most carefully and the form followed that looked to be the best at the time. Perhaps it was the only way at that time. I am rather of the opinion that it may have been so even if some change may be made in the future. No form can be considered best of all and every form has been successful at times.

Back in 1916 in Dairyman's League territory there were many who believed it would be better to wait until we could get many more local plants built and owned by farmers before we undertook to make a definite stand for our rights. I confess that I had that feeling considerably and it was only because of the onrush of the multitude that I favored the activities that were undertaken then.

Plant Ownership Plan Slow Work

Again it must have been in 1920 probably or early in '21 that I attended meetings held by the League to secure local ownership of plants, some to be built and others to be purchased and noted the extreme difficulty of quickly reaching the objective of local ownership of sufficient plants to make the local idea function successfully. For many years before 1916 efforts had been made to stimulate further ownership of the local plant. Then it was slow work and has been in every instance. The idea looks good. There are many such plants now but not enough to make a

(Continued on next page)

Piling Up Evidence

Mr. Harry B. Winters, Director of Dairy Division—N.Y. State Dept. of Agriculture, had an exceptional opportunity to observe barn equipment under all conditions. That he selected Loudon Steel Stalls and Stanchions for his own dairy barns, near Albany on the Bethlehem Center Road, is convincing evidence of Loudon superiority.

Why have the U.S. Government and thousands of good, practical dairymen in all parts of the country chosen Loudon Steel Stalls and Stanchions? One of the biggest reasons is the fact that they are properly designed. Another reason is the exceptionally high grade of material from which they are made—proved by years of service.

Stanchion Comfort—Pays Big

The Loudon Stanchion holds the cow in her place yet permits her just that freedom of movement which she must have to get up and lie down without struggling, bruising her shoulders or jamming her knees. Its V-shaped bottom allows it to be used in the feed-saving curb—a feature alone that saves many dollars annually.

Cows have "pasture comfort" in the barn when you use Loudon Stanchions. And true cow comfort always brings increased milk yields. Many a high producer has been "discovered" when changed living conditions gave her full ease and rest and let her get every drop of milk and every cent of profit possible from each pound of feed.

Quality material accounts for the unequalled strength and durability of Loudon Stalls and Stanchions—tubing is high carbon Open-Hearth steel—strongest and longest-lasting. Fittings are smooth—made of certified malleable iron, tensile strength 50,000 lbs. per square inch. Correct design. Free from trouble-making, dirt-collecting attachments. Neatest looking. Most sanitary.

Get Your Copy of This Booklet

Send at once for illustrated booklet telling all about Loudon Stalls and Stanchions. And if you are going to build or remodel a barn, ask for the Loudon Barn Plan Book—112 pages of money-saving building information for farmers. Shows 50 up-to-date barns with plans. Sent postpaid to farm owners—no charge or obligation. Mail the coupon.

Winters Farm,
Albany, N. Y.
Jan. 16th, 1923

Loudon,
Fairfield, Iowa

Gentlemen:
I have had experience with many kinds of stalls, stanchions and other barn equipment during the past 20 years.

I believe this is the most practical, simplest and finest barn I ever built for the production of certified milk and I selected Loudon Equipment for it because I am convinced it is the best.

Sincerely yours,
Harry B. Winters

Zinc Insulated

U.S. FENCE

There is no more economical or dependable fence construction than Zinc Insulated U.S. Fence supported by Banner (formerly Arrow) Steel Posts.

A heavy coating of zinc, uniformly applied to every wire of U.S. Fence, insulates it against rust and protects it under all kinds of weather conditions.

Banner Steel Posts, with their railroad rail design and large, slit-wing, patented anchor plates, root firmly into the ground, hold the fence severely in line, and give many years of service.

Both are sold at NO EXTRA CHARGE. Together they offer the greatest economy, giving many more years of hard service at less cost per year. Ask your dealer.

Let Your Cows Pay for That New Silo

They'll do it, and thank you for the chance. Here's how. You can fill a Harder Silo with succulent silage for less than the cost of husking, hauling and stacking the dry fodder. And when you come to feed it, it will be worth twice as much, to say nothing of being easier to handle. At the end of the feeding season your cows will have paid for a handsome new Harder-Victor Front Silo.

Harder Easy-Payment Plan

Under this liberal new plan you can meet the payments out of the increase in your milk check and the saving in feed cost. You can't afford to go through another season without a silo when your cows will pay for the best silo ever put on a foundation.

Write for our free book, "Saving with Silos," and particulars of our easy-payment plan. Study the strong points of Harder construction. Learn how you can make bigger profits with a better silo.

great co-operative association with power to deal successfully.

I have been thinking about the project and it looks as difficult to get the locally owned co-operatives to come into an organization—become federated I believe is the expression—as it ever has been to get individuals to join an association. Indeed it seems more difficult. It may be a great school that has its drawbacks.

Go where you will and see the difficulties of managing such an association and you will have some doubts as to the benefits of local control of milk plants. I am not wishing to object to local ownership but it has its difficulties. It may be that the League will some day adopt the idea of turning the plants it has to local control. Perhaps that might be best but it will be done after much debate if at all. It is a question to study carefully.—H. H. LYON, Chenango Co., N. Y.

Heifer Has Swollen Navel

We have a heifer that has just had her first calf. About a week or so before the calf came a swelling began to develop just in front of her udder. It continued to increase steadily until finally a day or so before she dropped the calf, it increased to such proportions that it was almost even with the lower part of her udder. It is over a week now since the calf was born but the swelling remains. We are kind of worried.—A Pennsylvania Reader.

There is nothing to worry about the condition you describe. Swelling at the navel is common especially with heifers at their first freshening. Holstein heifers are said to be particularly susceptible to this condition but it is not uncommon among other breeds.

Some breeders look upon this as a good omen of a heifer's future productivity. Whether there is any actual experimental data on this subject, we do not know. Nevertheless the condition should not cause you any undue worry. It should pass away in a short time.

White Diarrhea

Splendid Success of Mrs. Ethel Rhoades in Preventing White Diarrhea

Mrs. Rhoades' letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Rhoades tell it in her own words:

"Gentlemen: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. My first incubator chicks when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Dept. 438, Waterloo, Ia., for a \$1.00 box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."—Mrs. Ethel Rhoades, Shenandoah, Iowa.

Cause of White Diarrhea

White Diarrhea is caused by the Bacillus Bacterium Pullorum. This germ is transmitted to the baby chick through the yolk of the newly hatched egg. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that saves nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walko in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnett's Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walko. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. C. M. Bradshaw writes: "I used to lose a great many chicks from White Diarrhea, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 438, Waterloo, Iowa, for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail."—Mrs. C. M. Bradshaw, Beaconsfield, Iowa.

You Run No Risk

We will send WALKO White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for package of WALKO (or \$1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

WALKER REMEDY CO., Dept. 438, Waterloo, Iowa.

Send me the [] 50c regular size (or [] \$1 economical large size) package of Walko White Diarrhea Remedy to try at your risk. Send it on your positive guarantee to promptly refund my money if not satisfied in every way. I am enclosing 50c (or \$1.00). (P. O. money order, check or currency acceptable.)

How I Utilize Pig-Peskiners In the Hen Yard

EVERY year our little chickens died off by the dozens of gaps. There didn't seem to be anything that would save them. The old method of fishing for the gap-causing worms with twisted horsehairs, known to the older farm residents, was futile because of the numbers affected. The tightly covered box with its fumes produced by dropping carbolic acid on a hot brick helped some, but this cure often killed the weaker "patients".

Then my father, George D. Smith, veterinarian as well as farmer, decided to plow up the chicken run which had not been "turned under" since the farm was entered by Smiths more than a century ago.

It was certain that the untilled soil was the cause of the disease affecting the chickens so all possible earth about the chicken house and grounds was turned under, except that of a locust grove, there, evidently, since the world was. There was no way in which this ground could be plowed. It was here, either because of the shade, or because the hens liked to scratch in the half rotted leaves, that the little chickens spent much of their time and consequently "got gaps".

It was then that a litter shoots at the satanic age solved the problem. These pigs refused to stay in their specified habitat, but crowded through a wire fence and started rooting up the farm. They took a few turns in the locust grove, just by way of showing what they could do and this gave my father an idea. He put a temporary enclosure around the grove and penned those pigs in it just long enough to allow them to root up the ground. This they did to the queen's taste, or at least to their own, and to my father's satisfaction.

There has been no gaps among the chickens, at least but an occasional case, since the pigs came to the rescue.

—CLARA SMITH.

Sticks to White Leghorns

A YEAR ago we were asked to name our chosen breed and give our reasons for the choice. I was very much interested in all of the letters and agree with all who expressed the opinion that there is no best breed for all, but one best breed for each of us. We all seemed to agree that the breed that appealed to each one of us was the best for that particular person and we all tried to tell the best points of our choice.

Again our kind editor has extended us the privilege of reviewing these virtues and telling each other how well we have succeeded in the past year.

Doubtless you all remember my choice was the Single Comb White Leghorn, and if you should call on me you would probably find me out among my flocks of large snowwhite friends. I am fortunate to be located in the country away from all smoke and my biddies seem to take real pride in keeping clean. I think they have heard some of the favorable remarks about their whiteness and try to live up to them.

Attention Paid to Culling

I set my incubators three times last spring and sold part of the hatches as baby chicks and sold several pullets for layers. In the fall I had about 450 beautiful large vigorous pullets to put in my laying houses. They began laying in August and have kept at it continuously all winter. I had my hens culled by the Farm Bureau service and kept about 350 for breeders for 1925.

Early in the fall we enlarged our plant by the addition of a new Jamesway Poultry house, 18x56 in size and equipped it with all galvanized equipment. This coop has proven very satisfactory, ice freezing in it on only a very few oc-

(Continued on Page 288)

PAN-A-CE-A

takes care of the little-chick ailments

INDIGESTION—Diarrhea—Leg Weakness—Gapes.

It will pay you to look well to the digestion of your flock right from the start.

Indigestion is responsible for most of the bowel troubles.

Add Dr. Hess Poultry Pan-a-ce-a to the ration daily.

Pan-a-ce-a contains Nux Vomica; that promotes digestion—calls into healthy action every little chick organ.

Pan-a-ce-a contains Quassia, which creates a healthy appetite.

Pan-a-ce-a contains Iron to enrich the blood, essential to little chick growth.

Pan-a-ce-a regulates the bowels—keeps the chick's system free from poisonous waste materials.

No indigestion, no diarrhea, no leg weakness, no gapes, where Pan-a-ce-a is used.

REMEMBER—When you buy any Dr. Hess product, our responsibility does not end until you are satisfied that your investment is a profitable one. Otherwise, return the empty container to your dealer and get your money back.

GRANGERS TRIPLE PURPOSE GRIT

WILL MAKE YOUR HENS LAY MORE EGGS

It is sharp and clean, and absolutely the best substance that can be procured for grinding the chicken's food in the gizzard, and thus aiding digestion, and it is so white that there is no waste, as the chicken finds and gets it all.

NO NEED FOR OYSTER SHELLS

GRANGERS TRIPLE PURPOSE GRIT is superior as a shell-maker. It produces uniformly hard shells that will not break easily, and does away with any need of oyster-shell, magnesium, or any other such materials fed for shell-making.

BALANCES THE RATION—INSURES DIGESTION

GRANGERS TRIPLE PURPOSE GRIT has a definite mineral content of Sulphur, Carbohydrates, etc., which gives the proper balance to the food required by both chicks and adult birds to keep them in good health, and enable the chickens to produce the best eggs and more of them.

New York Farm News

Western County Notes by M. C. Burritt

A LONG period of open weather which culminated in a two days rain cleared the snow away very effectively and at much less expense than the town and county trucks did it. But the warmth and rain also brought muddy roads and yards and flooded fields. Then there came one of those sudden changes of late February and March and the mercury dropped to 5 degrees and 7 degrees above zero, with high March winds. The change was hard on man and beast, wheat fields and orchards. I fear the damage to wheat is considerable. What happened to fruit buds is not yet apparent.

Meanwhile it has been a slow week for farm work. It was either too muddy or too cold to prune trees most of the week, so we turned to odd jobs of which there are always a plenty, and the doing of which doesn't seem to get one anywhere, necessary as they are. Now that it is the first of March we begin to feel the urge of spring. The aim from now on will be to "get the jump" on the pruning, machinery, repairs, working up wood, etc., etc. so as to be forehanded,—to drive the work and not be driven by it. But much depends on whether the spring is early or late.

Markets continue in the reaction from the peak prices of early February. Farmers who were waiting for two dollars or more for wheat and didn't sell then, are still waiting and likely to be for some time. Cabbage prices are way off, and apple sales very slow. Prices may have to be shaded some to move the remainder of the crop rapidly, although storage holdings are unusually low. The hens thought it was spring, and egg prices tumbled from 55 to 60 cents in mid-February to 38 and 40 cents.

"Hot School Lunch" in Operation

This was our week to provide the hot school lunch in our district, and reminds me of the plan which some of the mothers in this district worked out last fall to provide the hot lunch during the winter months. It is inexpensive and may be of interest to some. There are about twenty-five families in this school district and a somewhat smaller number of children of school age who attend school in the district. Others go to high school two miles away. A committee of five mothers appointed at the annual school meeting worked out the following plan which has been in operation since December 1st.

Provision is made for one hot dish every day. Monday and Thursday it is cocoa. Tuesday, baked potatoes, and Wednesday and Friday any dish, preferably vegetables, selected by the mother in charge that week. The cocoa and the milk for it, are purchased out of a small cash fund mostly provided voluntarily by a few interested taxpayers who have no children in school and who do not take their turn in providing the hot dishes for a week. A small oil stove and kettle are provided by the district from tax money. The teacher who lives nearby brings the milk and supervises the making of the cocoa.

About twenty families agreed to take turns, each for a week, in providing the hot dishes. On Monday and Thursday the mother makes the cocoa syrup and sends it to school in the morning by the oldest pupils, the teacher heating it at noon. On Tuesday all the pupils bring their own potatoes and a little pat of butter. The potatoes are then baked in the school stove door. On Wednesday and Friday it is father's job to carry the hot dish to the school, and a slopping job it is if the dish is a soupy one like the creamed corn which I took up on Wednesday. Mother helped me out on Friday by sending rice and meat en-caserole.

The cooperation has been splendid.

Nearly every family that was asked has willingly done its part, even several who have no children in school now. A very few don't think it necessary. One woman remarked that if the children needed a hot lunch in winter they ought to have ice cream cones in summer.

The children too are appreciative and we all vote the plan a success.—M. C. Burritt.

New York County Notes

Genesee County—The potato and cabbage market is pretty dull. It was especially so around the last week in February. Many farmers reported that

badly especially those raised on the muck. We had ideal weather during the week and

get to work early on the land.—J. H.

Schenectady County—The February thaw came in very handy as many farmers were short of water. Hay has been bringing from \$12 to \$17 per ton and oats are worth 60 cents per bushel. Buckwheat is \$1 a bushel. Many farmers are looking for an early spring this year as several report having seen robins.—J. W. G.

Franklin County—We experienced real spring like weather the latter part of February. Cars and wagons came back into use again. Farmers had their ice houses pretty well filled and there has been more or less of a lull in the work. Milk prices are about the same and feeds still continue very high. Many farms are for sale or rent with practically no demand for farm property. County Veterinarian Mulvey is busy again testing dairy herds in the town of Westville. About the first of March the potato market suffered a decline, shippers paying only 35 cents a bushel. Auction sales are quite numerous. Hay is bringing \$20 a ton.—H. T. J.

Along the Southern Tier

AFTER being closed for some time by deep snow banks our roads are all open now, although some are quite icy. Frequent accidents take place to autoists who are shunted out of the track by ice ruts.

Very little hay is moving out of this section so far this winter, farmers holding the crop for better prices, which now range round \$12 to \$15 pressed. Straw is a better proposition, at about hay prices, but not many farmers have a surplus this year.

A few farmers have taken it for granted that the warmer days we have had mean spring and have tapped their sugar maples, especially those that stood in open places; but not many have ventured so far as that, believing that we are going to have some cold weather yet. Syrup is selling at \$2.25 to \$2.50 per gallon.

Little relief has come yet in the potato market. Prices run too low for any general movement market-ward. Seventy-five cents to one dollar is the limit, with more going at the first-named figure than at any other. It is easy to foresee a lessened planting for 1925, and that will mean higher prices for another year.

The price of road from Union Center to Maine village in Broome county is down for construction this year. That has been a bad piece of road. It is to be laid in cement and wider than usual, 16 feet.

Hired help is still at a premium and men will have to shorten up their farming operations for that reason. The Endicott-Johnson shoe shops have just paid a liberal bonus to their hands, and that fires men and women to quit the farm. Farm auctions are the order of the day, men disposing of their cows and the farm, too, if they can.—E. L. V.

On the floor is Pattern No. 538. The large rugs shown above, reading from left to right, are Patterns No. 323, 544, 554, 378, 398, 558, 546, 408, 518, 534, 321, 552, 386, 516 and 556. The small rugs, from left to right, are Nos. 534, 408 and 232.

“This Gold Seal is your assurance of complete satisfaction!”

“Right here, Madam, is the famous Gold Seal! It’s on every guaranteed Gold-Seal Congoleum Art-Rug! Pledges you absolute ‘Satisfaction or Your Money Back’—and means exactly what it says!”

True, purchasers seldom have to avail themselves of the Gold Seal Guarantee. But the seal itself, pasted on the face of every Congoleum Art-Rug and on all Congoleum By-the-Yard, shows that you are getting genuine Congoleum, with the full value and protection that the Gold Seal assures.

Only from rugs bearing the Gold Seal do you receive the service that has led thousands of housewives to buy more and more Congoleum Art-Rugs. Only in these rugs do you find the patterns that have been created by the world’s masters of rug design.

Absolutely waterproof and non-absorbent, Gold-Seal Congoleum Art-Rugs do not

spot or stain. Tiresome sweeping and beating are done away with, since a light going-over with a damp mop is all the cleaning required to keep them like new.

And Congoleum Rugs lie perfectly flat without fastening of any kind.

Popular Sizes—Low Prices

Valspar—*which color do you want?*

Perhaps you've some old furniture you want to renew. Or maybe you're planning to change the color scheme of your room. No matter what color you need, Valspar has it!

Valspar Varnish-Stains. Look at the chart at the left. There you have Valspar in beautiful transparent colors. Valspar Varnish-Stains are made of Valspar Varnish combined with permanent, non-fading colors to give natural wood effects, such as Light or Dark Oak, Cherry, etc.

You stain and Valspar with one stroke of the brush, thereby doing away with the old method of staining and varnishing separately. Valspar Varnish-Stains bring out all the beauty of the grain in the wood. Having all of Valspar's durability, they can be used for all work outdoors as well as indoors.

Valspar-Enamels—shown on the chart at the right. Valspar-Enamels combine all of Valspar's waterproof, wear-proof and weather-proof qualities with beautiful, opaque colors. They are applied like paint, covering wood or metal surfaces with a solid color just like paint—and have the added advantages of Valspar's brilliant lustre and durability. They may be rubbed down to a beautiful dull finish, if desired.

Send in the coupon—today—for samples of Valspar and Valspar in Colors. Be sure to send for the Valspar book which gives a hundred practical suggestions for using Valspar—indoors or out.

This Coupon is worth 20 to 60 Cents

VALENTINE & COMPANY, 460 Fourth Ave., New York

I enclose dealer's name and stamps—20c apiece for each 40c sample can checked at right. (Only one sample each of Clear Valspar, Varnish-Stain and Enamel supplied per person at this special price.)

Reviewing the Latest Eastern Markets and Prices

MILK PRICES

THE Dairyman's League Cooperative Association announces the following prices that dealers will pay the League during the month of March for milk testing 3% in the basic zone of 201 to 210 miles from New York City. It is to be understood, of course, that the prices mentioned below are not received by the farmer, but go into the pool. They represent the prices dealers pay to the League.

Class 1 Fluid milk\$3.07
 Class 2A Fluid Cream 2.20
 Class 2B Ice cream 2.25
 Class 2C Soft cheese 2.15
 Class 3A Evaporated whole milk
 Cond. whole milk 1.90
 Class 3B Whole milk powder 1.85
 Class 3C Hard cheese other than
 American 1.65

Class 4 prices will be based on butter and American cheese quotations on the New York market.

Sheffield Producers

The Sheffield Farms Producers announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1 \$3.07
 Class 2 2.20
 Class 3 1.75

Class 4 prices determined by butter and cheese quotations on the New York market.

Non Pool Cooperative

The Non-Pooling Dairyman's Cooperative announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1 \$2.80
 Class 2 2.20

Class 3A	1.80
Class 3B	1.75

Interstate Producers

The Interstate Milk Producers Association (Philadelphia Price Plan), announce the receiving station prices or the price to the farmer in the 201 to 210-mile zone from Philadelphia for 3% milk is \$2.19. In the 101 to 110 mile-zone, the price is \$2.29.

BUTTER GOES HIGHER

A break for the better came to the butter market on the last day of February. Many men in the market had predicted this but with the market facing the more or less unfavorable statistical condition it seemed rather unwise to make any definite predictions. Any man's guess was good. It seems the upward turn in the market has been due more to out of town buying. It is this trade outside of the regular channels and regular customers that is bidding the price up. On top of this, shipments are more moderate, considerably lighter than a year ago. There is no indication that we will have any great quantity of foreign butter dumped on us so that the situation looks rather favorable. It may be that we will see something of a slight check if out of town storage butter is shipped in. That happened a week or so ago. At that time prices in New York were above par compared to other cities and they immediately shipped to the Metropolis to gain the advantage of the price differential. Cold storage stocks during the week ending February 28th were reduced appreciably. On the whole the situation is very satisfactory.

Creamery butter scoring better than 92 score was selling on March 4 from 46½ to 47c with 92 score selling around the 46c mark. Other grades varied downward to 35c as the inside quotation on the lowest grades.

CHEESE CONTINUES FIRM

The cheese market continues to hold up to its past performances, maintaining a firm tone on high grades of held goods. This firmness is most apparent on fancy marks of held State flats. Indications are that before long we will see this firmness reflecting on prices. On March 4, 26c was the top mark on fancy to special held whole milk State flats but reports current in the trade had it that sales were being made by local up-state dealers at 26c, F.O.B.

Average run held flats are worth from 25 to 25½ with undergrades varying from 21 to 24½c.

There is very little fresh cheese in New York. Some of the best marks are quoted at 24c while some purchases have been reported at 23c delivered in New York.

EGGS CONTINUE DOWNWARD

The egg market has suffered a rather disastrous week. Receipts have been responsible for the situation, particularly those of competing grades from western points. Fancy nearby whites have not suffered near as much as brown and colored nearbys.

Chicest marks of nearby hennery whites are worth in the neighborhood of 39½ and 40c with other grades working downward to 34c for ordinary firsts. Undergrades are worth from 32 to 33c. Gathered whites are worth anywhere from 32 to 37c. Small eggs grading as pullets are worth only from 30 to 31c. Brown eggs have got to be extremely fancy to bring 35c.

Our recommendations of the past few weeks hold good by comparing New York and country prices. On March 4 M. C. Burritt wrote us that eggs were worth from 38 to 40c in his section of Monroe County. On March 2, the very highest price paid in New York was 40c. Shippers can afford to study costs and prices very closely these days.

POTATO MARKET DULL

The same old song is being sung in the potato market and indications are that the tune bids fair to continue. It is certainly discouraging to go into the potato market and try to pick up some interesting news. It is a buyer's market out and out. States on March 4th were worth anywhere from \$1.50 to 1.75 per 150 pound sack delivered in New York City. Country asking prices are higher varying from \$1.80 to 1.90

Readers who have been following our advice given several weeks ago about watching other markets have been repaid of late by doing business in Pittsburgh. The Pittsburgh market has been decidedly better than the New York market.

One of the discouraging facts of the past week was the arrival of the first Southern potatoes. The season's first carload of new crop Florida potatoes rolled in the New York market on February 28. It consisted of Spaulding Rose variety. The ear was well graded and the potatoes were of good quality. They met a limited sale of \$14 per barrel for No. 1 and \$12 for No. 2. This is rather a shock to northern growers many of whom would fall all over themselves to get \$2. Much of this can be traced to the fickleness of the New York consumers. They are always looking for something out of the ordinary and pay enormous prices for it.

HAY MARKET STILL WEAK

The hay market as a whole is not satisfactory. Demand is slow on average grades. However, where fancy top grades are concerned there is slightly better inquiry. No. 1 timothy is worth from \$25 to 26, with No. 2 \$1 less. No. 3 hay is at \$20 and sample hay anywhere from \$15 to 19. Light clover mixed is worth from \$23 to 24 for No. 1; \$20 to 21 for No. 2; and \$17 to 18 for No. 3. Second cutting alfalfa still holds to \$30 to 31 for No. 1, with No. 2 bringing \$25 to 26 and No. 3 bringing from \$23 to 24. Alfalfa mixed hay is bringing usually \$21 to 22. No 1 rye straw is worth \$18 to 19.

* * *

The future market in wheat continues firm. Trading has not been as heavy but the strong undertone has held prices up. May wheat is now \$1.99¾ with July at \$1.73¾ and September at \$1.56¼.

CLASSIFIED ADS

SEEDS—NURSERY STOCK

CABBAGE PLANTS. You should use our FROST PROOF cabbage plants and get your early cabbage in the markets two to four weeks earlier than you can by using home grown hot house plants. Early Jersey and Charleston Wakefield, Succession, and Flat Dutch. Prices f. o. b. here by express: \$1.25 per 1,000, 5,000 for \$5.00, 10,000 for \$9.00. Should you desire shipment by parcel post, add \$1.00 per 1,000 to above prices. Satisfaction guaranteed. S. M. GIBSON CO., Yonges Island, S. C.

Fill a Big Job
Qualify in Eight Weeks
to Earn Real Money in the
Auto and Tractor Business

Come to the great shops of McSweeney where thousands of dollars have been spent in the latest tool and equipment. Stay only eight weeks, then step out as an expert. My training made Louis Beimer a Foreman at the age of 24. It started O. H. Justus in what is now a big business. It enabled E. Rushfeldt to earn \$10 a day. It has helped hundreds of others to do as well or better.

Big Firms **ed Men**
 I get calls every day from Garages, Battery Stations, Auto Repair, Welding Shops, and other successful firms for McSweeney men. The big fellows need trained men right away and they know where to come for them.

Railroad Fare Free
 That's my proposition for a short time only to help fill these vacancies. But that's not all. If you write at once I'll give you the lowest tuition rate ever offered.

Get This Big Free Book
 This large illustrated book tells how others are succeeding. It tells many things you ought to know about Autos and Tractors. Write for it and send no money now before it expires. Write to nearest school for it today.

We Bring Farmers' Week To You

Here Briefly, Is The Best Of Everything Seen And Heard

By MABEL G. FEINT

Editor's Note: How often when attending Farmers' Week at the State Colleges of Agriculture we have heard people deplore the fact that they could not be at two places at the same time. There are so many excellent and interesting things to be seen and heard going on at the same hour that it is impossible for one person to see and hear half that he wishes to.

But we have overcome, to some extent at least this difficulty. If you were at Farmers' Week, and were able to take in only part of the interesting lectures, or if you were unable to go at all, you can get in a few minutes' reading of this article by Mrs. Feint the outstanding thoughts made by the speakers and a glimpse of the interesting exhibits which were to be seen.

The State Colleges like those at Ithaca, New York, State College, Pennsylvania and New Brunswick, New Jersey, are doing an immeasurable service to the farmers of the present and of the future. And not the least of their services are the great annual gatherings at Farmers' Week when the people from all over the states come together to suggest ideas and to get new ones from the lecturers.

In this remarkably well reported article by Mrs. Feint, you get the best of what took place at the last Farmers' Week at the New York State College. We most earnestly commend it to your reading.

Dr. Liberty Hyde Bailey: "The farmer must make more than a good living. He must develop as a man in his attitude toward his calling and toward society. Civilization cannot maintain itself if care of the soil is given to cheap men."

Dr. George F. Warren: "Children should not be improperly worked. But every time we pass a law to prevent improper child labor there should also be one passed to compel proper labor of children. Every child should be taught a trade before he is eighteen years of age, so his fingers could make a living if his brain should fail to. It is too late to do it later in life."

"We are now educating our children to go to the cities, which is not the right kind of reciprocity. If the cities paid half of the expense of educating rural boys and girls they would be only educating their own citizens, as that is where half of them will go."

Dr. Carl E. Ladd: "One big thing which farm people can do to help in the present situation is to so plan their labor that as much of the living as possible comes direct from the farm. More meat should be produced directly on the farm. There should be at least two pigs and a cow killed each year for the average family. The farmer's wife should know how to can meat, to cure dried beef, to make corned beef, and to make sausage. Every farm should have an adequate vegetable garden for year around needs, plenty of poultry and eggs, and more fruit and berries. Farm prices have risen 30 per cent since the War. But what the farmer has to buy has risen 60 percent. One way to help meet the greatly increased taxes and expenses is to make adjustments so as to depend more on the farm's production and less on purchases and so save towards taxes."

Prof. Martha Van Rensselaer: "Every member of the family who can should work. There must be no parasites. Everyone should know what he or she is worth in dollars and cents. People should spend less than they earn. Make a budget, keep accounts, save systematically, and pay bills promptly. Use bank credit when necessary instead of store and personal credit. It is the bank's business to loan money, not the grocer's. Challenge all purchases to see if they are good value. In general, invest in lasting things, such as health and education, rather than in those

things which give merely momentary satisfaction (To the housewives) Your services as manager are worth about 75 cents an hour; for other work, about 40 cents an hour. So in reality you are really earning a considerable sum each day, though the pay received is in other forms than money."

Dr. Faith Lorimer: "What we are really after is not money, but satisfaction. A budget is a plan by which money income is transformed into the real income which will give the family the greatest amount of satisfaction."

Dr. Carl Ladd: "I would like to say that the hard times are all over for farmers. But I do not think that they are. They will probably last for some years to come. But there is one thing to consider when times are hard—and that is that we do not need to be too pessimistic. We have always farmed it through wet and dry seasons, through fat and lean years. Farmers have been through such times before. In these days it is easy to kick and complain about the state's finest institutions, to tear them down and to gain an audience in the doing. Some men today are flourishing by driving wedges between the Home Bureau, between the Farm Bureau and the Grange, and between the farmers and their organizations and institutions. We should not say there shall be no criticism of such valuable groups as the Grange, the Home Bureau, Junior Clubs, or the College. But let it be constructive criticism. Just good team work everywhere will be invaluable now. It is easy to let little things upset us and to criticize our leaders and workers. But destructive attacks do not make for growth or help movements of the day. I have said this to Farm and Home Bureau managers and would like to say it to your groups: 'Make this group your group; accept all constructive criticism, put your shoulder to the wheel and all push in the same direction. We all owe much to the agriculture and the homemaking of the State.'"

A New Definition for the Home Bureau: (With apologies to a newspaper reporter who is describing Ma Ferguson, the new governor of Texas). "Ma is just a plain woman, a woman whose instincts are maternal, and whose interests and ambitions center in the welfare of her husband and children. But when you take that kind of a woman and equip her with a big idea, and push her into the political arena (or any other arena) and tell her to go to it, something large, exciting and decisive is bound to happen."

Mrs. G. Thomas Powell believes this describes the rural woman, and the Home Bureau arena sees large achievements bearing fruition.

AWED COWBOY—How Come you're able to stay on that bronc thataway, mister?

TENDERFOOT—Oh, I've driven a Ford car over bad pavements for years.
—JUDGE

Rural Pastors' Conference: "Week day religious education is the big job of the church today. This may be given in several ways, through daily vacation Bible schools, on Saturday mornings, in the church training class once a month."

"It is foolish to stop short of using the great power of the public school for use in giving broad training in spiritual matters. It should be undenominational and has been demonstrated that Catholics, Protestants and Jews may alike find profit and satisfaction in right courses of instruction, properly administered. Our superintendent of public instruction in Pennsylvania has signified that he is ready to entertain suggestions to this effect. As yet no denomination has asked him to do anything along these lines."

"I have gone into thirty school districts where almost no one went to church or Sunday School, and have given religious instruction to both Catholics and Protestants. After a course of instruction, the children signified a desire to live a Christian life. No opposition resulted. It can be done if the heart is right. It takes time, energy and initiative; but the results to the church and to the world are wonderful."

Seen At Farmers' Week

A Nursery School: Fourteen children from two to five years old, under competent supervision, working, playing, sleeping, taking cod liver oil with their mid-forenoon orange juice, and enjoying every minute. The toys were simple, but so designed that really constructive results could be had. The children soon come to regard helping themselves as real fun as everybody is doing it. They set their tables, serve, and if they spill they clean up. They wash their dishes and take care of their dishpans and towels, and adore it all. Mothers were advised by experts as to health and management problems. Two big rules in the nursery schools conducted by Dr. Nellie Perkins are: Each child learns to take care of what he has or plays with, and each is taught to finish everything he starts.

The Home of a Hundred Comforts: A model of a house showing correct electrical lighting and appliances in every room. That the coming housewife will be interested in electricity was shown by the careful inspection given this all day long by many visitors. This was but a part of a very complete exhibit of labor saving equipment and utensils for the home, presided over by Prof. Ruth Kellogg, and Miss Edna Smith, popular with farm women because of their fine work in extension through the Home Bureaus.

An Apple Show Where You Could Buy Real Apples: And how the people did eat apples, bushels and bushels of them; not Oregon apples, but the finest, juiciest, fragrant kind such as grows to perfection on the farms of York State.

Rural School Exhibit: An exhibit having almost none of the old stereotyped school exhibit features; one which thoughtful persons found deserving of an hour or more of careful study; one that showed that those young people making it appreciate the beautiful and wonderful in nature and are possessed of keen powers of observation. The mounting was handsome and artistic. Some of the newer things shown were: exhibits of various types of camp fires; charts of wild animal tracks; over 30 collections of evergreens, twigs, and woody plants such as are seen in winter; nature calendars illustrating the alphabet, with some object in nature, with original rhymes and jingles, and with

(Continued on Page 291)

New Jersey Farm News

Farm Bureau Leaders Meet at Trenton

FARM Bureau Federations in eight eastern states sent representatives to the Northeastern regional conference of the American Farm Bureau Federation, held in Trenton, N. J., February 26 and 27, under the general auspices of the New Jersey State Farm Bureau. Nearly one hundred delegates and farm-

York, Pennsylvania, Connecticut, Massachusetts, New Hampshire, Delaware and Maryland including a generous attendance of Home Bureau leaders from four of the eastern states.

The delegates devoted their time to the consideration of business problems affecting the Farm Bureau in eastern states and the policies underlying the movement, with particular attention to the cementing of relations between the Farm Bureau and other agricultural organizations and institutions.

Permanent Membership Discussed.

The trend of the discussions pointed to a growing opinion among Farm Bureau leaders that Farm Bureau member-

basis, instead of the annual two or three-year renewal basis. The need of healthy community locals, active upon local problems which hold the membership intact throughout the year, was emphasized as an important pre-requisite to successful Farm Bureau work. The appointment of strong, active, local leadership and the development of local men experienced in stimulating Farm Bureau work, was emphasized by delegates from a number of the states.

The importance of informing the individual members of the activities of the County Board, State Federation and national organization, brought forth considerable comment. Lack of funds in some of the eastern states has prevented sufficient extension of an informational service, so that the membership in many states is not posted on what the Farm Bureau has done for farmers. The efforts of the Eastern federations to meet this situation will be extended during the coming season, various of the delegates stated.

New Jersey Farm Bureau Gaining.

The meeting was called to order by President H. B. Hancock of the New Jersey Federation, who called attention to the increasing prestige which the Farm Bureau in New Jersey enjoys. H. E. Taylor, Executive Secretary of the New Jersey organization, reviewed the progress of work in the state during the last five years.

President Enos Lee of the New York State Farm Bureau Federation and member of the National Executive Committee, as chairman of one of the business sessions, emphasized the need of particularly friendly relations between the Farm Bureau, Extension Service, College and other agricultural institutions and organizations.

Other States Progressing.

President J. C. Brubaker of the Pennsylvania State Federation gave a particularly favorable report on the growth of the movement in his state, where difficulties in establishing Farm Bureau work have held back the organization work to quite an extent.

Secretary M. Melvin Stewart of the Maryland Farm Bureau said that the work in his state was gaining because of the close tie-up of the Farm Bureau with various commodity and educational associations of farmers. President J. D. Reynolds of the Delaware State Federation, likewise reported a healthy condition for his state. New Hampshire was represented by a delegation of six, including four of the Home Bureau leaders. Connecticut and Massachusetts

reported good progress within the last year.

Membership on Quality Basis.

All of the Farm Bureaus represented reported a loss in membership from the boom period of a few years ago, but stated that this was a healthy sign of progress in that the membership in the East is now largely upon a quality basis. Mrs. Ida S. Harrington, president of the New Jersey Home Bureau, was chairman of a special session devoted to home and community interests.

The conferences urged the appointment of a State Home Bureau chairman to head up the woman's interests in each state. The invitation of New Hampshire to hold the next regional conference at Concord, N. H., was accepted.

Eastern Pennsylvania Notes

OLIVER D. SCHOCK.

THE Cumberland County Fruit Growers' Association elected Galen Gates of Shippensburg, as its president; C. M. Miller, Newville, vice president; Harold Mowery, Shippensburg, secretary, and J. H. Dunlap Shippensburg, treasurer.

Owing to heavy snowfall, rabbits and field mice proved unusually destructive to orchard trees during the winter. Thousands of trees were ruined by being completely girdled at their base by these pests. One nursery alone lost over \$3,000 worth of trees and shrubbery. High grade seed corn of select varieties commands from \$2 to \$5 per bushel and is in good demand. A very large proportion of Pennsylvania farmers find their home grown corn of immature growth and lacking in germination.

Abner G. Deyshe of Reading was elected president of the Reading Fair Company at the recent organization meeting of the board of directors. A. Lincoln Frame was elected first vice-president; William M. Croll, second vice-president; George W. Brumbach, third vice-president; Charles W. Swyer, secretary, and Romanns Esterly, treasurer. Thirty-five directors were elected, after a spirited contest.

Maple trees are already beginning to yield the annual flow of sweet sap which pours hundreds of dollars into the pockets of their owners. Prices of maple sugar and syrup are high for the "first crop" boiling. The bulk of the crop is bought by city dealers.

It Pays to Write Your Representative

(Continued from Page 271)

his work is unappreciated, as is quite often the case, and he slowly but surely slows down. He begins to do only the absolutely necessary things and lets the rest slide. If we don't say anything he will go over and help a friend get his fliver tuned up.

The issue therefore rests with us. He would be just as good as ever if we had been on the job. Yet when the work isn't done right we curse him. He really wasn't to blame and most of us would have done the same thing.

This is just as true of our officials, whether they are Senators, Assemblymen or Dairymen's League directors, as it is in the case of the hired man. If we don't do our part we can't expect them to do their part. If we don't turn out at the meetings and election time, when it is our turn at the wheel, we ought to be careful what we say after our neighbors have elected a man. Let us boost the man in the office as long as he is there. When his term is up if he hasn't done right and if we know of some better man it is up to us to put the better man in.—C. F. B. Tioga Co. N. Y.

That last apple and Ford Lubrication have much in common

PUTTING cheap oil into your Ford engine is like risking a tumble by reaching for that last apple on a dangerously high branch. Even if your engine *does* keep out of the repair shop, the amount you are trying to save is only a pittance. At the most, it can hardly be \$5.00 a year, *even if poor oils gave as good mileage.*

But cheap oils *don't* give cheap mileage. Low price per quart never indicates low cost per mile.

Mobiloil "E" has won its popularity on low-cost-per-mile. In addition to lower oil bills, the almost universal experience includes such benefits as—

**More repair-free miles
Decrease of carbon and fouled spark plugs
Smoother running and more powerful motor
Minimized frictional heat**

You can quickly prove this by calling on a responsible Mobiloil dealer near your farm. Mobiloil "E" is not peddled around from door to door by "job lots oil men" who get their oils from no one knows where.

The Mobiloil dealer is more interested in keeping you for a steady customer than he is in loading you up with long-profit, short-performance lubricating oil.

On his wall he has the Mobiloil Chart of Recommendations which specifies the grade of Mobiloil for every motor. Gargoyle Mobiloil "E" is correct for Fords.

In the differential of your Ford car use Gargoyle Mobiloil "CC" or Mobilubricant as specified by the Chart of Recommendations. In your Fordson Tractor use Gargoyle Mobiloils, "BB" in summer and "A" in winter.

castous this winter. It is exceptionally well ventilated and the birds therein are very healthy and have given a good egg production all winter and although they have been laying and under lights continuously they are not showing any signs of molt.

The early molters that were culled from the breeders were placed in a house by themselves, forced for egg production during the late fall and winter and sold on the market as the price of eggs dropped and their production ceased. Every day is a culling day at Hillview for I always keep an eye open for any bird not up to the standard in looks, production or condition. By this means I have developed a flock of large vigorous layers of which I am proud. 1925 finds us installing a new Mammoth Jamesway Incubator that we may care for the increasing demand of chicks from our flock of single comb White Leghorns.—Mrs. Floyd Owen, New York.

What Good Care and Feeding Will Do

WE read so many interesting letters from other poultrymen, we thought perhaps our experience would be interesting to others. On November 1, 1922 we started with 95 pullets and 20 yearling hens of the Tom Barron strain of White Leghorns. We did not keep separate records but for the year ending November 1, 1923 they had laid an average of 164 eggs apiece and brought returns above feed of \$2.60 per hen.

In April 1923 we bought 300 day-old chicks at \$20 a hundred. When 10 weeks old we shipped 150 broilers that brought 47 cent apiece. This was a small profit as they had cost us 40 cents (20 cents buying price and 20 cents feed). We raised 133 pullets at a cost of 83 cents apiece when 6 months old. November 1, 1923 we started the year with 133 pullets and 55 yearling hens. The pullets laid an average of 170 eggs apiece and the yearlings 155 eggs apiece. The total returns above feed for the year ending November 1, 1924 were \$551 or \$2.93 per hen. On April 21st, we bought 300 day-old chicks of the Hollywood strain. As it was a bad spring to raise chicks we lost over sixty. We shipped 110 broilers at 35 cents apiece. We raised 127 pullets that cost us 91 cents apiece when six months old. We are starting the year with these and about the same number of yearlings and two-year-olds. The pullets began laying in October, laid 33% in November and 60% in December and are doing even better in January. The yearlings were all late molters so are not laying much yet but will make a record later. Our chicken run is a 4 acre pasture, fenced with poultry netting and has a small creek running through it. An ideal place.

These results have been obtained only through persistent care, methodical feeding and great variety of feed.—J. E. Howard, New York.

More About the Brown Leghorn

IN a former article I failed to mention one trait of the Brown Leghorns that we found quite a prominent one, that is, their everlasting propensity for laying everywhere under the sun but in the nests. As our first pullets were in a part of the barn, we didn't notice it so much but the second year's being near the house they laid in every conceivable place imaginable; under the front step,

behind a rose bush, in the washing machine on the kitchen porch, behind the wash tub and several times when the truck was left out, they flew up and laid on the cushion.

One day just as my husband started for town with a truck load of produce he heard a slight noise behind him and glancing around found he had a pullet with him. She had been settled down among the stuff ready to lay. He stopped and let her out and when he returned home went back to look for her. He found her sitting on an egg by the roadside near where he had left her. As Mr. Northrop makes pets of his hens, they are tame and he can pick them up anywhere. When they were on range we decided we lost enough eggs to make up for any difference in production if they had been yarded.—E. M. Northrup, New York.

Kill Rats and Stop Leaks

We hear a lot about the leaks. The trouble is that a lot of folks do not realize where to look for the leaks. Rats and mice constitute one of the biggest, as far as actual loss and destruction is concerned. The following letter brings out this fact very forcibly. Undoubtedly if folks were to conduct a campaign such as this they would realize the advantage in using rat proof construction, involving the use of concrete and other methods to keep down these losses through these destructive agents.

LAST spring in March, when I discovered in the corn bin a couple bushel of cobs that had been cleaned of corn by the rats, my ire was aroused and I vowed then and there to make war on them.

In the fall my son had bought 4 or 5 steel traps at this time they were not in use, so I set two of them in the corn cobs and two in the feed box, fastening them well. Next morning there were three rats caught and nearly every morning there was either one or two of the rodents in the traps. By the way in the feed box where the traps were set so that the trap and chain showed plainly so that the men could see it and avoid it. I sprinkled feed over the pan and edges of trap to decoy Mr. Rat.

Thus during those three weeks I surely caught 150 rats. Through the summer I did not bother to set the traps but again in the fall I set the traps in the feed box and nearly every other morning there has been a rat caught sometimes so large I would have to call Spot, the farm dog, to kill it and after he had killed one he runs back to see if there is another. Up to the present time I am still catching two or three a week in the traps which are left set in the corner of the grain box.

Once or so when I was near the grainary there has been a rat in the trap during the day, which I removed and reset the trap. We farmers do not stop to think how much valuable grain is destroyed by mice and rats.—E. Z. Salls, New York.

Chilling Chicks Is Usually Fatal

IN the early spring when our chicks are exposed to chilling winds even when the sun shines there is grave danger of their chilling. One severe chilling is usually enough, for they are likely to become sick even though at the time they do not appear to have suffered. One very common way for those in brooders to chill if there is no heat in

(Continued on next page)

HILLPOT Quality

STURDY PURE BRED CHICKS HIGH-EGG-YIELD

Their Sturdy Vigor

makes them ideal for early broilers. It enables that snappy activity that is quick growth's closest ally.

That's another advantage of Hillpot hatching—where eggs from profit strains, during the whole period of incubation, are under the constant, experienced scrutiny of experts. Result: The chicks uniformly have that quality PLUS which features Hillpot Quality Chicks.

HOLTZAPPLE CHICKS

The folks that know about them, buy them

For 18 years we have been in the chick business and year after year our old customers come back. In 1923 and also in 1924 we sold 100,000 chicks to people living within 20 miles of our hatchery. The folks that know us best buy from us. 11 BREEDS. OHIO ACCREDITED. White Leghorns, Anconas, White and Barred Rocks, S. C. and R. C. Reds, White and Silver Laced Wyandottes, White and Buff Orpingtons, Rhode Island Whites. Pure-bred flocks from America's foremost exhibition and laying strains. Every bird inspected by men trained and authorized by the Poultry Department of the Ohio State University. Write for catalog and prices.

Trapnest Record 192 Eggs Average

"I selected and trap-nested 13 White Leghorn pullets, of pedigree mating, out of my flock raised from 500 day old chicks. Their average was 192 3-13 eggs. The balance of the flock would come up to these records if trapped." (Signed) L. MARTINSON, Palisade, Minn.

NOTE: We have Mr. Martinson's record and sworn statement in our office files.

Won 187 Ribbons \$226 Prize Money

"I want you to know of my success with the 25 White Rock day old chicks bought from you. In the 1923-24 show season, I showed at 23 shows and fairs, winning 3 championships, 43 firsts, 43 seconds, 187 prizes in all, besides \$226 in cash." (Signed) STANLEY GAIDA, Miller Falls, Mass.

Booklet of many testimonials like these on request. Nabob Quality stock is noted for its exceptional laying and winning qualities. Be sure to order Nabob Chicks this year.

them is to press against the glass through which the sun shines. The glass is cold and the sun is warm, and those back keep pushing forward and press those close against the glass with the result that they chill. Another way is for them to bunch up outside trying to get warm when they have no warm place they are in the habit of going. Sometimes when flocks run with hens some old motherly hen will settle to hover her flock while the others continue to scratch. The lively chicks go with them while more and more of those getting chilly will leave the mothers which will not stop to hover them and push under the one that has, and so many come that they push each other out and all chill. I had ten hens that had chicks of a size one year and roamed much together and this took place and in a week I had lost nearly half of the flock, though they only had chilled the once. I am sure there were a hundred chicks trying to get under the old hen when I discovered them. The other hens had three to five chicks apiece and were busily working away. Glass fronts in coops or brooders should be high enough so the chicks cannot reach them, and every flock without a mother should be trained to run into a warmed coop or brooder when cold. If the warmth is always to be found they will soon learn it.—L. H. Cobb.

Give the Hens Plenty of Water

ANYONE who has watched a hen eat a few mouthful of dry mash and start for the water supply or take her last drink before going to roost or a first one after getting off the roost, cannot doubt the importance of a constant supply of water. Yet it is often neglected. In one coop we use a fountain of the vacuum sort. Water stays at about the temperature that is put in for a long time. In the other one with an oil lamp. These are filled when the hens are fed at night. A short pipe attached near the henhouse to the main that supplies the barn, furnishes them with a constant supply in summer.

Alfalfa is Fine for Green Feed

AFTER sprouting oats two winters, we decided it was quite a chore, so last winter we tried steaming alfalfa. We found it so much easier and the hens like it and did so well that we would always use it for green feed whenever we could always get it. A small amount was put into a pail then very hot water poured in and the pail covered till the alfalfa was green and fresh when it was ready to feed. Only a small amount of water should be used. When we cannot get alfalfa we save the undeveloped cabbages and use them for that purpose, also some cull apples, turnips and even apple and potato parings.—E. M. Northrup, New York.

Likes Jersey Black Giants

SEEING your request in the January 24th issue for readers that have tried new breeds of chickens, I thought I would send a few lines. I have raised Barred Rocks for 25 years and thought they were the best of chickens until I bought a setting of Jersey Black Giant hatching eggs in May, 1921, and raised them along with the Rocks and Reds. When the Rock cockerels weighed 3 pounds each the Giants weighed 6 pounds, same age and feed. The Giant pullet laid first egg on November 21,

BARRED ROCKS

DAY-OLD CHICKS
From 4,000 matured hens. Bred for utility and size.

MARVEL POULTRY FARM, Georgetown, Del.

Red pullet, November 22 and the Rock pullet January 12th.

The Giants have a fine yellow skin when dressed and are the best table fowl. They are very hardy and easy to raise. They feather very young and I do not get any naked or twisted wing chicks, as I did in the Barred Rocks. They will roam the fields like turkeys if given free range and do very good if yarded. I entered three Giant cockerels at the Peckskill, N. Y., poultry show November, 1924, and won 1st and 2nd prizes. They weigh and win what more could one ask for.—H. D. Pinckney, New York.

Room Temperature for Incubator

THE actual temperature of a room not so important as having it average almost the same all the time. It should not be too cold for few incubators are safe if the heat has to be maintained too intense to keep up the temperature inside and circulation is so much more rapid when the difference is great that bad results often follow no matter how careful we are. On the other hand the room temperature should not be too high or circulation will be so slow the chicks will not get enough fresh air. Between fifty and sixty degrees is a very good average. Little difficulty will be experienced in keeping almost any incubator regulated where the room temperature is maintained around fifty-five with even a ten degree rise or fall at times. Frequent ventilation of the room will keep the air moist and fresh.—R. Rae.

We Bring Farmers' Week to You

(Continued from Page 286)

drawings and paintings showing real artistic skill; nature dramas, well planned and giving evidence of imagination and literary skill; relief maps showing the effect of winds and mountains on climate and topography. These excellent exhibits were prepared and shown with no thought of reward other than ribbons, and show what can be done by and for rural boys and girls. A big group of educational folks listened to a talk on Cornell School leaflets by E. L. Palmer, the author of these leaflets, whose inspiration is back of most of the exhibits. These leaflets are regarded as the best of this kind of information to be found. Libraries are seeking them, and individuals are most regretful that they are available only to teachers, so quickly are the various editions exhausted. Some of the latest, most popular titles are: Witches Brew, Woody Plants, Invertebrates, Birds of Prey, Cultivated Plants, Camp Fires. The leaflets are beautifully illustrated and not only teach a love for all nature, but how to use, protect, and conserve the things about us.

Clothing and Millinery: Modern, artistic examples of skill in making dresses, smocks and hats were shown. The talk and demonstration on "Time Saving in Sewing" filled the lecture room to capacity. Good tools and knowing just what to do enable the homemaker to outfit a well dressed family on half the expense, and give the process something of the speed and a lot of the results of professional work.

Shrubs for Winter Effect: A big collection of winter fruit bearing shrubs, (Continued on next page)

OHIO ACCREDITED CHICKS

Every bird comes up to the standards set by the Poultry Department of the Ohio State University, and every breeding bird has been inspected and leg banded by inspectors trained by them.

HEALTHY CHICKS MEAN LARGER PROFITS. The health of our flocks is of the very best. We keep our birds in the open on free range under natural conditions and they have the vitality to produce bappy, healthy, lively chicks which grow into profitable birds. Our flocks have been carefully culled and bred for years for high egg production. Special Combination Orders—Write today for free catalog.

WOLF HATCHING & BREEDING CO., Dept. 2, Gibsonburg, O.

BABY

CHICKS

LAWRENCE P. UHL

A PIONEER IN THE BABY CHICK BUSINESS. For 20 odd years I have been producing high class Baby Chicks which have gone out to thousands of Poultry people of America and proven highly satisfactory. For years previous to 1919, when he retired, I was associated with M. Uhl, New Washington, Ohio, who was Father and originator of the Baby Chick business, making the first shipment of Baby Chicks 25 or more years ago. Since 1919 my output has been entirely taken by dealers who supplied a long line of year after year customers. I have now decided to give the GENERAL PUBLIC an opportunity to buy my high class Chicks direct from the Hatchery here at New Washington and I am in a position

to furnish these excellent Chicks in almost any quantity and on short notice at the following prices:

	50	100	500	1000
100% Live Delivery Postpaid. Prices on				
White, Brown and Buff Leghorns	\$7.00	\$13.00	\$62.00	\$120.00
Sheppard Anconas, R. C. Brown Leghorns	7.50	14.00	68.00	130.00

evergreens of various sorts, and ground covers for shade and for sunny places gave valuable hints for improving home grounds. Some of the most beautiful berries and winter effects shown in shrubs, all native to New York were: winter berry or northern holly with brilliant red fruit, ideal for Christmas or all winter decorations; bittersweet berries; Japanese rose, with many branching twigs and small red berries; red cedar, evergreen, with blue berries; wild rose; Regel's privet, close clusters of round black berries; hardy and beautiful; shrubby St. John's wort; English privet, larger, black berries; bladder senna, peculiar leaves; many berry or black paw, beautiful also for flowers, foliage fall colors; high bush cranberries; purple and Japanese barberries; coral berry; and bayberry, with silvery white berries.

* * *

The "Fashion Follies": Living models were chosen to illustrate the main types of women, the tall and thin, the short stout, the tall stout, the petite, the youthful and older types, blondes, brunettes and other types each wearing dresses, hats and coats loaned by merchants and criticized by Miss Beatrice Hunter, expert in dress problems. The garments were all good if worn by the right persons, but as in life, the wrong women wore them first for criticism. Later the same women wore the right things and though these were no more expensive, the improvement in the individual was marvellous. Lastly, each model, with both the wrong and the right selections were shown on the screen in silhouette, the real test of right choice. The silhouette and good spacing (color is very important but was dealt with last year) determine the becomingness of the garment. New York State rural women, through the Home Bureau classes, and at Farmers' Week, are getting valuable training in what and what not to wear and are adding much to their efficiency, self-respect and the joy of life.

* * *

The Farm Shop: Farm blacksmithing, welding, tempering the pickaxe, chisels and all kinds of cutting tools, harness mending and efficient equipment for the farm shop to enable the farmer to help himself in the scarcity of blacksmiths of the present day, were shown. Simple water systems were a big feature.

More About Acid Phosphate

Continued from page 272

ash. To substitute only acid phosphate would be a decided mistake. For instance, if Long Island farmers tried to use only acid phosphate on their potatoes they would suffer discouragingly results. They use large quantities of a complete fertilizer and they use only high grade materials. Similarly with some crops it does not pay to use high grade complete fertilizer, while it does pay to use a light application of acid phosphate.

Lime the Acid Correction

The acid that is used in making acid phosphate is not the same as the acid condition that we usually find in the soil. Acid soil or sour soil usually results from a preponderance of organic acid caused by the disintegration and rotting of organic materials, such as roots and vegetation in general.

To correct this we use lime. Lime is just as important in renewing old pasture land as acid phosphate. Again refer to Jay Gelder's story on alfalfa and you will see that where he used both lime and acid phosphate, he got the highest yield.

It all comes back to one question—

What are you going to put it on? It makes a great deal of difference whether you are talking potatoes, cabbage, beans, corn, hay or alfalfa, to say nothing of the dozens of other crops that respond to the application of fertilizer.

Better Seed Association Elects New Officers

Bruce P. Jones of Hall, N. Y., was re-elected president of the New York Seed Improvement Cooperative Association at a meeting of the board of direction here recently. F. C. Gibbs of Fillmore, N. Y., was elected vice-president to replace E. E. Hufts, who recently resigned. Etta M. Conover of Ithaca was re-elected secretary-treasurer.

F. C. Gibbs was elected a director for a term of three years. George W. Lamb, of Hubbardville, was elected a director for a term of one year.

The auditing committee for the next year was chosen as follows: O. R. Robson, of Hall, Charles H. Riley, of Senett, G. R. Alexander, of McGraw.

The following chairmen were appointed for the crop committees: corn committee, J. W. Alvord of Kirkville; oats committee, B. Z. Kasson of Gloversville; wheat committee, O. R. Robson of Hall; barley committee, Professor J. H. Barron of Ithaca; beans committee, John S. Rich of Marion; potato committee, Charles Huff of Moravia.

The report of the secretary-treasurer showed a membership of some 210 farmers and a bank balance of \$4,437.13.

The resolutions committee consisted of F. C. Gibbs, W. A. Jones and O. R. Robson; the nominations committee included Seymour Bridge, L. J. Aldridge, W. A. Gardner and Clarence Barker.

Town Forests for Berkshire County

DAVID STONE KELSEY

WILD fire never travelled faster over forested areas than has the recent excellent fashion of not only state, but county, city and town forest associations.

Hitherto Connecticut has taken the lead, having already nearly thirty state parks and forests, and her towns beginning to follow suit; but there was formed just recently, at Pittsfield, the Berkshire Forestry Association, two cities and twenty of the thirty towns of that county being represented in the charter membership. Berkshire County thus captures the distinction of being the first county in the United States.

Great initial impetus has been given to the movement through offers made by Cortlandt F. Bishop of Lenox, and Z. Marshall Crane of Dalton, jointly, who will give \$150 to each town in the county that shall acquire at least 100 acres of suitable land for a town forest within two years.

The officers elected are as follows: President, Kelton B. Miller of Pittsfield, owner and editor of the Berkshire Eagle; vice-president, James A. Hardman, editor and owner of the North Adams Transcript; secretary-treasurer, Harold S. Osborne of Pittsfield; executive committee, the above, with Frank J. Pope of Great Barrington, and John M. Goodrich of Lee.

A good filler for cracks in stoves and furnaces is made by combining equal parts of salt and wood ashes into a paste.

Promoting the Purebred Industry

Continued from page 269

for \$4.50 a hundred weight, or \$2.25 each. The same aged lambs sired by a purebred ram sold for \$7.35 per hundred weight, or \$4.38 each. It is a case of over 100 per cent greater returns to the farmer who uses a purebred ram. In this case, as in many others, the purebred ram doubled the income from the lamb crop, through the same kind of ewes, same kind of feed, and the same kind of care was given both lots of lambs.

But why go on with proof? A thing once proved should not need further substantiating evidence. Consequently, in this article, we shall let the foregoing concrete examples of proof stand as final and declare that the purebred animal is more valuable to the farmer than the common kinds of livestock. That admitted, what can be done further to sell the idea to the 96 percent who haven't made a definite choice of the kinds of animals they wish to produce?

Advertising Sells a Product.

Purebred animals must be sold. The idea that purebred animals are expensive and a luxury in the farmer's hands must be dispelled. The four percent, who now know the value of bred-for-production farm animals, must pool their efforts and merchandise their product. It can be done.

One man has made the American public chew gum. He has done it by advertising. It is said that he spends over \$5,000 each day of the year telling the public that to chew gum is good for them. And he has made them believe it.

Not long ago Mr. William Wrigley and a group of friends were riding between New York and Chicago on the Twentieth Century Limited. One of his friends said, "Mr. Wrigley, why do you continue to spend \$5,000 a day advertising your gum? Everybody uses it and everybody knows about it. I think you don't need to do it any more. Why not cash in on what you have spent?"

"This is one of America's finest trains," answered Mr. Wrigley. "Everybody knows about it. We are speeding along at a splendid rate now, so why not disconnect the engine and cash in on what has been spent?"

Publicity and advertising furnish the power and momentum that sells gum and every other worth-while product, just like the engine furnishes the power and momentum for the Twentieth Century Limited. Without it, a commodity moves in our well-organized market channels just about as far as a crack train will move without an engine.

The Greatest Asset in Business.

What is publicity? Publicity is any fair means by which a commodity may be correctly pictured in the mind of a person, who, heretofore, has known little or nothing of the commodity to which the publicity pertains. All right! Now let's use it. Let's tell the world what we have for sale. Let's demonstrate to them that purebred livestock is a necessity for the pursuit of health and happiness on the American farm.

Before we start, let's clean house. A satisfied customer is the greatest asset of a business. So, let's be prepared to satisfy the purchasers who may buy our purebred animals. Let's get rid of the culls and not shove them off on some buyer who cannot help but become dissatisfied with his cull and who at once sets out to poison the minds of all with whom he comes in contact, thus killing our publicity. Let's make honest records on our dairy cows, the kind that any good dairyman may hope to duplicate, should he purchase the cow. Let's show only hogs in the spring pig classes that were farrowed after March 1, because everyone knows that if we will show overaged hogs in the pig classes, we are likely to be dishonest about other things. Let's put a fair value on our purebreds,

and, lastly, let's not be afraid to have anyone visit our breeding plant at any time. Now we are ready to do business.

The avenues open, offer splendid opportunities of publicity at the local, county, district, state and national fairs. Millions visit the fairs annually and if your exhibit is worth while, you will make some degree of impression. Be sure, however, that your purebreds are in good fair show condition, for if they should not be they only serve to injure your sales and that of your fellow breeder.

Join a Cow-Testing Association.

Join a cow-testing association and show the world you have cows that produce at a profit. Don't continually tell your friends that your cows give "A pail of milk" and then forget to tell how large the pail is.

Get into the ton-litter contest. Be the first man to enroll. If you are worthy of the name purebred breeder, you should fear no competition. Purebreds have always won.

See that there is a calf club, pig club, lamb club and poultry club in your neighborhood. The boys and girls of America will show their dads the superiority of purebreds, if given a chance. Each one they convert to your cause is an addition to your potential market. County after county could be cited where the calf club or the club has changed the color of the stock in the county.

Join or organize a local breeder's club. Wisconsin has over one hundred such clubs. Their secretaries are usually men who have some gift of salesmanship and act as agent for those who do not understand selling. Some of Wisconsin's county breeders' associations sell from 3,000 to 4,000 animals for breeding purposes each year.

See that your local and state farm papers get the news of your production and show ring winnings. Always make it a point to give publicity to sales you make when those sales may be compared with the sales of common stock in your neighborhood.

Invite your neighbors and the doubting Thomases in to see a cow milked that is producing a big record. They then might believe their own eyes. Show them the check you received at the creamery, or for the sale of a bull calf, ram lamb or boar pig. Cash often speaks louder than words.

Use every possible means you can think of to present the facts to the public that your kind of purebred animals is the best. Never knock the other fellow, but continually boost. Coordinated action along all these lines and others, will put power in your business and furnish the momentum that is necessary to make your purebreds sell.

I know of no merchant or manufacturer, who, if he were told that 96 percent of all the farm population in America was needing his product, would not find a way to tell that 96 percent how badly they needed his product and how well he could supply them. Imagine you are the merchant.

Irate Farmer—What are you doing on my property?

Professor—Merely making the acquaintance of the flora and fauna of the locality.

"Oh, are you! Well, don't let me catch you running about after any of my farm girls!"—PASSING SHOW (London).

The Trouble Maker—By E. R. Eastman

Jim Taylor's morale is rather shaken by the fact that in spite of his mother's sudden death, he must go on trial the very day following her burial. Following the funeral Dave Messenger, the sheriff, visits Jim and they have a heart to heart talk. Their conversation brings out the fact that Judge Rising is a scoundrel at heart. Years previous he had conducted a fraudulent business that wiped out Dave Messenger's worldly possessions and was responsible for the death of the little sheriff's wife. He promises a revelation at the trial, which opened the next morning. No trial in years had attracted so much attention.

MANY in the crowd had been there a long time. Since early morning the seats had all been full of both men and women, patiently waiting for the trial to open. The buzz of low-voiced conversation filled the air.

Over in one crowded corner a discussion of the milk fight was taking place.

"Most of our farmers began drawin' their milk yesterday mornin'," said George Pratt, from Honeyport. "We couldn't stand the gaff forever, you know."

"Yes," said young Jerry Waldo, sarcastically, "just as I expected. If we farmers should stick together for a whole two weeks, it'd surprise me so I'd drop dead!"

"Well," said Ralph Royce, "young Taylor's gettin' mixed up in this spilled milk business hasn't helped the cause any. Might better have been traveling around tryin' to give us farmers more information and encouragement."

"What are we," returned Waldo angrily, "a lot of children that we've got to be petted and encouraged all the time to do something for our own good? You make me tired."

"That's all right for you to talk, Waldo," said Royce, "you've got some money. But there are a lot of poor farmers that'll take more'n a year to get over the effects of this fool strike."

Waldo turned his back on the other man and there was no more said.

Sitting well towards the front of the room was Caroline Hicks, and with her were some of the other women from North Speedtown. If the signs were right, today promised big for Caroline.

"Didn't Miz Taylor look just grand in her coffin?" said Caroline by way of an opening.

"Did she?" asked Bessie Rightmire, the wife of the keeper of the little country store in North Speedtown. "I declare I couldn't get to go. Wanted to awfully bad."

"Yes," said Caroline, "but I swan when I saw that Ball girl come in there to that funeral, I couldn't help but feel glad that old Miz Taylor was gone."

"I heerd old Johnny was there, too," said the other. "Seems though he had a lot of nerve to come trapsin' up there after all he's tried to do to Jim."

"They say young folks will be young folks," said Caroline, "but they ain't no excuse for the way that girl's been carryin' on. Nor for this young Jim either. They do say as how he was the death of his poor old mother."

The other woman nodded her head.

"Well," she answered, "it's a good thing poor Miz Taylor didn't live to see her son's disgrace today."

Old Mrs. Simmons, sitting in the seat directly ahead, turned around at this and said mildly to the Rightmire woman:

"There can't be any disgrace, Bessie, if Jim is not guilty—and no one thinks he is."

Carolina nodding her head. "I know he is."

"How do you know?" asked Mrs. Simmons.

"Well, I know, but I ain't goin' to tell now. I just thought it was my bounden duty to go and tell Will Hamilton, the district attorney, what I know, and he's goin' to call on me by and by. Needn't think I'm goin' to tell anyone now."

Ann Jenkins, sitting a little further along in the same row, had been an interested listener to this conversation.

"Huh!" she said, "I'm certainly s'prized at you, Caroline! This is the first time in the thirty years since I've known you that you had anything to tell and didn't tell it—and I don't believe you have anything now," she added.

Just as Caroline opened her mouth to make a fitting retort, the door on the opposite side of the courtroom swung back, and through it came a short, aggressive looking man, who walked importantly across the open space in front of the judge's bench, deposited some law books on the table, and took his seat. He was Will Ham-

ilton, the district attorney of the county. Both the defense and the prosecution used their right to excuse some of the talismen for various reasons. Winslow did not seem to like some of the villagers who apparently were antagonistic to the striking dairymen, while the prosecution tried to keep as many farmers off of the jury as possible.

But for the most part, the jurors were accepted after a brief examination and took their places in the box. When it was completed, there was a representative American jury, some men from the various trades and professions in the village and some farmers; all common sense, American citizens, "good men and true".

After the jury was selected, the judge beckoned to Hamilton, the prosecuting attorney, and they whispered together for a few minutes. Then Hamilton went back to his place and opened the case of the State of New York against James R. Taylor, defendant. He began in a loud, harsh, unpleasant voice, walking back and forth as he

heartless manner. After which they seized the team of horses, turned them around in the road and roughly put said Mead back on the wagon and started him toward the Ball farm, with many dire threats of what they would do should he attempt again to deliver said John Ball's milk."

Not a sound could be heard in the courtroom except the lawyer's unpleasant voice. Most of the crowd had heard the story before but here was the district attorney claiming that he had proof that Taylor led the gang that dumped the milk. Could it be possible, thought some of Jim's friends, that he had been mixed up in that affair and if so, could the district attorney really prove it? Their worried looks showed that they thought this might be true.

"Moreover," continued Hamilton, "we will prove that this defendant, James R. Taylor, did not disperse his gang after the assault on William Mead, but instead, waited until John Ball himself came along on the second attempt to deliver his milk to market in a lawful and peaceful manner. We will prove that for the second time this defendant, supported by his accomplices, in an unlawful and criminal manner, stopped said Ball's horses, and we will produce witnesses to prove that this defendant led his men onto the wagon of said Ball and threw all of the milk cans in that wagon into the ditch, spilling the milk, also jamming and nearly ruining the cans. These together with other facts which we will produce witnesses to show, will prove to you, your honor, and to you, gentlemen of the jury, that this defendant James R. Taylor, is a trouble maker and a dangerous criminal, unsafe to be allowed at large in society."

"Trouble maker!" My goodness!" growled Mrs. Jenkins behind her hand. "Jim Taylor wouldn't intentionally make nobody no trouble."

"Mebbe not," answered Caroline Hicks, in an excited whisper, "but I know what I know. You won't be so cock-sure about this Taylor when you hear all of Mr. Hamilton's witnesses!"

But for the most part, both the men and the women that crowded the room were silent, some worried and some curious as they waited during the short pause in the proceedings before the prosecution called its first witness. They did not have long to wait.

"Mr. William Mead will now take the stand."

The tall, ungainly form of the hired man came ambling down the aisle. He was directed to the witness stand and the clerk proceeded to swear him. "Do you promise to tell the truth, the whole truth, and nothing but the truth?"

Bill put his hand upon the extended Bible, blinked a moment, and promised. "If he does, I certainly shall be s'prized" said Ann Jenkins. "It'll be the first time in his life!"

In a voice that had lost some of its belligerency, Hamilton began the examination of his witness.

"Will you kindly tell the court your full name?"

"Pa and Ma christened me William, but generally I'm known as Bill."

"Now, Mr. Mead," said the lawyer, "just answer my questions and don't give any information I do not ask for."

"Wise lawyer," commented Mrs. Jenkins to her neighbors.

"What is your occupation?"

"I work for Johnny Ball. But don't lay it up agin me, for I'm goin' to quit and go to town. Johnny's gotten so grouchy—"

"Now, Mr. Mead," interrupted the lawyer, raising his voice, "just answer my questions and don't tell anything I do not ask for."

(Continued on Opposite Page)

"The Trouble Maker" In The Boy's Home

WHEN the mail arrives here everyone by common consent downs tools for fifteen minutes. Archie who is sixteen usually fetches it in from the road and if a hurried examination of the bundle shows the American Agriculturist, he retires into a quiet corner and with the pages opened at "The Trouble Maker." He is quite oblivious as to what good or bad news the rest of the mail contains. By the time the rest of us get through the letters, a glance through the papers, our consciences are crossed once more that this is the forenoon and work still waiting to be done. If Archie has finished the installment we get him up without much trouble, but nothing short of force will get him to go if he hasn't.

He goes to his work with a contented smile on his freckled face and if Dad and he are working together,—they are usually splitting wood these days—then the time passes cheerfully telling Dad all the exciting events he has read and asking questions. He is a terror for asking questions; always was.

After dinner there is another half hour respite and if he can possibly get hold of the American Agriculturist he re-reads the story, more leisurely this time and there are chuckles and explosions every now and then. He is particularly fond of Bill Mead. After supper you will notice him giving it a third reading and telling his younger brothers who are busy with their lessons all about it. After its third reading he seems satisfied that he hasn't missed anything and turns over the pages to look at the other things.

Perhaps you might think this was the finish up?—No—he has a bundle of A. A.'s away upon a high shelf out of harm's way and every now and then he will have one down reading over again some particular chapter that takes his fancy. It would be interesting to hear from other readers if their experience is similar to mine.—Mrs. T. Thomson, New Brunswick, Canada.

ilton, the district attorney of the county.

A moment later Winslow appeared in the door. He wore his swallow-tailed coat, carried his silk hat in one hand, while the other was thrust through the arm of Jim Taylor. The tall man was smiling. But the other's face was a little pale. He looked tired, and he still carried one arm in a sling.

After a moment of silence, in which the crowd stared at the two lawyers and Jim, the hum of conversation started again, only to stop abruptly as another door back of the bench opened and the county judge entered. Everybody in the courtroom rose to his feet, while the judge walked across the little platform and took his seat at the bench.

"I declare," whispered Ann Jenkins, "ain't it s'prizin' what these men voters will elect to office! Lookit that apology they have for a judge, now."

There were few in the crowd who did not agree with her, although not many would have dared put their sentiments into words.

"Ain't he enough to make one sick to their stummick!" said Ann. "Looks like the big hog he is."

The judge took his seat at the bench. The preliminaries of opening court were quickly completed. Jim Taylor's case was called, and the lawyers began selecting the jury.

For a wonder this did not take long.

talked, and swinging his arms vigorously.

"We are going to prove," he said, "this defendant, James R. Taylor, guilty of one of the most heinous crimes that has ever been committed in this county. We will prove that on the morning of Tuesday, October 3, 1916, this defendant, at the head of a gang of disguised dairymen, whose identities are unknown to this court, did twice interfere with the peaceful and lawful delivery of the milk belonging to John Ball. We will prove that said defendant, assisted by his gang, did stop the horses of said John Ball on the road leading from the Ball farm to Speedtown in the lonely hollow near a deserted barn known as the Harris barn and that said defendant and said gang did pull William Mead, the authorized agent and hired servant of John Ball in a felonious and criminal manner from said Ball's wagon on which he was proceeding peacefully to market."

"Huh," grunted Ann Jenkins to herself. "That lawyer's right, for once. I'll guarantee that Bill Mead was proceeding peacefully. Never knew him to miss an opportunity to go to sleep yet!"

"Then," proceeded the lawyer, "not satisfied, this gang of highwaymen led by the arch-conspirator and criminal, this defendant, did sorely assault said Mead, knocking him to the ground and jumping on him in a most cruel and

"All right," said Bill, "but I thought you got me here to tell what I know." "Huh," said Mrs. Jenkins, "that wouldn't take long!" The judge brought his gavel down with a resounding whack. "Silence in the courtroom!" he roared. The witness will answer the district attorney's questions without any additional comments." Bill scratched his head and looked bored. "Where were you on the morning of Tuesday, October 3rd?" "Several places," answered Bill. "Got at four o'clock, put the cows in the barn, and had 'em about all milked before Johnny—" "That'll do," roared the lawyer. "Who delivered Mr. Ball's milk on Tuesday, October 3rd?" "Nobody," said Bill promptly. The audience snickered. "Mr. Mead," said Hamilton, "tell the jury who went with the milk on that morning." "Well, several of us took turns at it," said Bill. Again the crowd laughed, and the judge's gavel came down. "I'll clear this courtroom if silence is not maintained!" The judge leaned over his bench and spoke to the lawyer. "Suppose you let the witness tell his story in his own way." "All right," said Hamilton. "Mr. Mead, tell us just what you know about what happened on Tuesday, October 3rd."

"Well, I got up at three o'clock, put on my overalls, and went out to look for the cows." The lawyer threw up his hands in despair. "Never mind that! Never mind that!" he roared. "What we want to know is what happened when you went with the milk." "I was comin' to that," said Bill moderately, "but I don't believe in beginning a story in the middle. Cuttin' out the perlimineries, after I got outside of my salt pork, flapjacks, and 'taters, me and old Johnny hitched up Pete and Duke, loaded in the milk and then Johnny says to me, says he, 'Bill, you get on and take the milk down to the station, but if anybody says anything to you, just keep still. Don't have no trouble, and don't say nothin' back'. So I got on, clucked to the nags, and down the road we went, as peaceful as could be. Gone mebbe about two miles, came over that little knoll that leads down into the hollow by the old Harris barn, and I was kind of ridin' along in the sun and wonderin' if I had eaten enough of Miz Ball's pancakes to last me until dinnertime, when suddentlike, I heard a funny noise, and I looked up and by gol, over the fence and down the bank into the road was comin' more than forty men and every one of them sons-of-guns had his face covered up with a black cloth!" Bill paused, and took a look over his almost breathless audience. Never in all his life had he created a sensation

like this. Certainly must make the most of it. He continued: "The robbers all commenced to run toward me, and to holler 'stop' and 'halt', but I had great presence of mind—that reminds me," he interrupted himself, "of another fellow that had great presence of mind—" "Never mind! Never mind!" shouted the district attorney. "Go on with your story!" "Well, these here robbers I was tellin' you about was all on the upper side of the road. I hung onto my lines, lowered myself behind some of the milk cans, and hollered the horses into a gallop. Then them highwaymen began to shoot. Some of the bullets struck the cans,—

"That'll do!" That'll do!" said Hamilton, jumping up. Bill looked up surprised and hurt. "Your honor," said the lawyer, turning to the judge, "with your consent, I had better question this man. He is wasting the court's and the jury's time." "All right. Proceed," said the judge. Then Hamilton turned to question the witness again. All of his politeness had left him. He walked over close to the witness chair. "Now, Mead," he said, shaking his finger uncomfortably close to Bill's nose, "I'm going to ask you some questions, and I want you to answer those question with just 'yes' or 'no'." Bill's face was getting red. "Now, tell us," said Hamilton, "if you ran your horses, how did it happen that you did not get away?" "Yes."

"What do you mean, 'yes'?" "You told me yourself to answer your questions yes or no, and that's what I'm tryin' to do," answered Bill with some asperity. The lawyer turned to the judge, and threw up his hands. "Your honor," he said, "this witness is just plain obstinate." The judge leaned forward and glared down at Bill over the top of the bench. His little eyes snapped.

Better Than Bitters

Spring Salads and Doctors Who Are Not Doctors At All

OUR modern housewife might be compared to the painter, who when asked how he mixed his colors replied, "with brains". The serving of foods is very important. Especially in the late winter and early spring our appetites are often very capricious. Nature is telling us we need a tonic. Salads made well and served attractively will make us all feel better. The garnishing contributes to the food values, it seems.

We do not need expensive dishes to serve attractive meals. At our ten cent stores we often find beautiful dishes at a very reasonable price. An ordinary dessert looks very elaborate when served in fruit glasses with a stem like a champagne glass.

A lemon may often be called into play as a successful decoration. Cut the lemon in thin slices. Baskets may be cut out, even to the handles. Quarter sections of the lemon may have zig-zag strips of pimento on them.

Have A Salad Color Scheme

Watch your mixtures and do not place together vegetables of the same color, for example beets and tomatoes, or tomatoes and carrots. Serve your beets with spinach, and tomatoes with cauliflower or cabbage.

Make use of your canned goods, and serve plain vegetable salads. A general favorite is the best salad. Chop the beets and a small onion together. Make a boiled dressing of half a cup of vinegar, half a cup of water, tablespoon sugar, salt, pepper and a small lump of butter. Boil it until it thickens and then beat into it the yolk of an egg and pour over the beets and onions. Serve with tiny balls of cottage cheese, and you have a very attractive salad.

The hens are now filling the egg baskets full. Let us use some at home. Boil six eggs hard, cool, peel and chop coarsely. Moisten with the above dressing, and sprinkle with finely chopped cucumber pickles or celery.

Serve on lettuce or cabbage leaves—if you have them.

For a good vegetable salad boil two parsnips, two carrots, two potatoes and a small turnip all together. When done but not real soft, drain, cool and dice. Add a small onion to the mixtures, and a hard boiled egg and moisten with salad dressing. Salt and pepper to taste.

Fruit Adds Variety

Sometimes, mold your vegetable salad and slice, and serve with mayonnaise on top. Dice peaches, pears, and apples together, and whip cream and pile on top, sprinkle with nuts, and you have a perfect salad, or dessert, which ever you wish to call it.

Salmon and potato salad always tastes good in the spring of the year. Boil the potato in the skin, cool, peel and chop. Add a large sour pickle, cut small, and add a sweet red pepper. Open a small can of salmon remove skin, and bones. Flake carefully. Mix lightly, and add sufficient salad dressing to moisten the ingredients. Serve with thin slices of red pepper, and rings of hard boiled eggs.

For a special treat purchase a firm head of cabbage. Whip one third cup of rich sour cream until light. Whip in the juice of one lemon, or three tablespoons of vinegar, a teaspoon salt, and one third cup sugar. Be governed to the season by your taste. Some like a sprinkle of pepper, others, ground mustard, celery, onion or garlic. Beat all together until well distributed. Shred or cut your cabbage and mix with this dressing, which will be sufficient for three pints of cabbage.

Once again let us use our brains, and be careful with our combinations.

—Mabel Fern Mitchell.

How I Put the Sunshine Into My Kitchen

OUR kitchen was a north room with absolutely no sunshine in it. The two windows were on the north side and there was no door to any other exposure as it was enclosed on the other three sides by rooms and a shed. It had a dismal dark paper and dark gray woodwork.

We painted the wainscoting and all the

These six will gladly you attend,
If only you are willing;
Your mind they'll clear, your ills
they'll mend,
And charge you not one shilling.

Kansas State Health Bulletin

other moldings a light cream yellow. I happened on some paper of a light cream color with a "Dutch Milkmaid" border with little windmills in the background. The floor was painted a yellow brown. There were three old-fashioned kitchen chairs which I painted the cream of the paper. With cream-colored draperies at the windows, the room was metamorphized and everyone who entered it would exclaim "What a lovely kitchen you have".

—MAUD MARTIN GIFFORD.

Baked Potatoes

IT is now generally agreed that the potato baked with its skin on is much more valuable than the pared and boiled potato. Since this plentiful home grown vegetable has a valuable amount of the minerals most important to the body—iron, lime and phosphorus—why pour these desirable materials down the kitchen sink when they may be saved by baking?

Then too, not everybody bakes po-

a fork, but squeeze them with the hand wrapped in a towel. When soft, break the skin to keep them from being soggy, and serve. If desired, a bit of butter and a dash of paprika may be placed in the opening made in the potato.

A Little Bunch of Miscellany

MOST country women are busy and as I'm no exception to the rule, I'm always alert for a short cut to lighten the day's routine, so I learn much by watching other women's methods and sometimes I learn what *not* to do by the same experience.

For Instance! When I ran over to see a neighbor the other day, she had her window out, a tub of suds on the floor and with much expenditure of water, soap and energy was cleaning her windows.

I came home and got better results in a fraction of the time by using a cloth dampened with gasoline, then polished with a dry cloth. This leaves the glass gleaming with none of the cloudiness one has to contend with when using soap and water, and I never take a window sash out to clean unless it is impossible to reach it otherwise.

Butter Making Short Cuts

Instead of laboriously washing and working the milk out of butter with a paddle as many women do, I drain away the milk, put in plenty of cold water and wash the milk out by churning process. And after using several kinds of patent churns and observing others, I now use—from preference—the old-time stone churn with a dasher. It may take a few minutes more to get the butter, but I would as soon spend the time getting butter as in cleaning out the intricacies of a patent churn.

The most nerve-racking time for me, however is that put in at mending and I do all of it when possible on a sewing machine.

Torn laces can be nicely mended by a basting paper (dark paper preferred) on the underside, then with the machine one can almost form a pattern, more firmly and quickly than it can be done by hand, and the dampened paper is easily removed. A run in silk hose can be mended the same way. Baste a

Simple, Yet Effective Luncheon Set

E2241-3 may be had in color-fast blue or yellow linen-finished suiting. The cloth is 36 inches square with four napkins to match and sells for \$1.25 stamped. Floss for set, not including edge finish 60c. Floss for set, including edge finish 75c.

tatoes properly, simple as the process may seem. The State College of Agriculture instructs us to wash and scrub the potato thoroughly and bake them from forty-five minutes to an hour in a hot oven (400 degrees to 450 degrees F.) Be sure to have the oven hot before the potatoes are put in. To test the potatoes do not pierce them with

strip of paper along the run, work the stocking carefully under the machine foot and sew down the length of it with fine silk thread. Tie the ends and it is hardly noticeable.

Incidentally and miscellaneously—a good tight barrel laid down and well staked, makes a most excellent dog-kennel.—Mrs. R. G. Armstrong.

We Can Make Our Own Dyes

As Well As Our Clothes

IN SOME localities the art of dyeing with roots and plants, barks and seeds has become lost, and yet from the very best of "boughten" dyes it is difficult to get the pleasing tints and colors that our grandmothers brought out of their dye pots.

For dyeing dark fabrics use any heavy black iron kettle, but for lighter ones a copper kettle is preferred.

Materials to be dyed should first be dipped in warm water and wrung out very dry, as this prevents spotting. It is also possible to sprinkle very damp, roll and lay away until every thread is evenly and thoroughly dampened.

The green outer husks of walnuts yields a rich brown dye that has the advantage of being sun proof, and a lovely golden yellow is secured from the petals of the common sunflower. If the vivid yellow of the latter is to be darkened, this can be done by adding a little of the walnut.

Boiling, That's All

For the brown dye, simply boil the green husks or shucks until the desired shade is secured.

The sunflower dye is a little more difficult to make. Remove the petals, put in water and bring to boiling point, then drain. Put the petals in a fruit jar and cover with denatured alcohol. Let stand forty-eight hours, to each cupful of the alcohol add four cupfuls of the water in which petals were boiled, and the dye is ready for use. In using this dye, set on the back of stove and heat slowly to allow the alcohol to evaporate without danger of igniting.

Some dyes are best set with what is called a mordant, and for this purpose a solution made by boiling sumac, hemlock or similar tannin-bearing barks is excellent. Dip the goods in this before putting in the dye.

Barberries make a lovely yellow dye if treated the same way as the sunflower petals. The ripe fruit of the high cranberry gives a beautiful lilac shade, but the fabric to be dyed should be first dipped in the tannin solution, dried and then dipped in a solution made by dissolving one ounce of tartar emetic in a quart of soft water. Double the amount if the garments to be dyed are large.

Geraniums for Wine Red

Geranium petals may be used and make a beautiful wine red. If the garment is later washed in soapy water, however, the color will turn to a plum color, having a greenish tinge, the shade being very beautiful.

The home dyeing of light silk blouses, doilies, scarfs, etc., is recommended because of the fact that new and charming shades can be procured in this way.

If a dye similar to the soap dyes is desired, the juice from grated carrots will give any shade of yellow, orange or cream desired, and beet juice will give pink and red shades. Spinach juice gives green tints.

If a bit of emergency dyeing is to be done, the fact that the nearest store is miles away need not worry the clever housewife, for curtains rinsed in weak coffee become a delightful ecru color, and a few drops of common bluing will work wonders in freshening a faded ribbon. Be sure the ribbon is thoroughly dampened before the bluing method is used however, else it will surely spot.—L. M. Thornton.

More Sewing Hints

NOW that the white goods—and other goods!—sales are flourishing, the housewife who can replenish her stock of towels, sheets, pillow slips and other household staples should do so. Often in these sales there are remnants which will serve many of our purposes, at a

greatly reduced price.

When sewing by hand, using a double thread, instead of tying the two ends in one knot, tie a knot in each of the ends and use a single thread. This actually prevents the thread kinking up and becoming snarled. Keep a "reel" of English twilled tape (white) in your work-box or several reels of varying sizes would be better. Use this tape for binding, or to enforce a seam, or as shoulder straps on every day underwear, camisoles and the like. Stitch a strip of it on, when you stitch the underarm seams of a one-piece dress or any such garment. It prevents the side seams sagging and the garment

sets better. The above and other similar uses call for a tape 1/2 or 3/4 inches in width, or wider if desired. The 1/4 inch or narrower is extremely handy if you make the children's underwaists and union suits. Use the two-hole bone buttons made for the purpose and tape them on just as "boughten" ones are fixed.

Make your own tags for marking garment, with this tape. Use any width desired and mark with your initial or name. Cut off and stitch to the article you wish to mark. The wider widths allow you to embroider the letter or name on if preferred, or indelible ink may be used on the narrow tape.

Cut a finger end from a cast-off kid glove and slip it over the end of the finger you are always pricking when you sew or crochet.

Rompers From Shirts

A man's dress shirt will usually outwear two pair of cuffs and still have much good material in it. If there is a wee tot in the family the shirts may be cut into pretty rompers with little waste and good results. Cut the front of the romper from the back of shirt and use the shirt fronts for back of romper. This saves working new buttonholes and sewing on new buttons as those already on are used.

When sewing buttons on a coat or other garment where it is desirable to have them "loose" so as to button easily after taking the first stitches up and down through button, draw it up a little from goods, put needle up through; bringing it out under the button. Draw out thread and wind several times around the threads holding button to the coat. This forms a "shank" which helps make the garment button easily. Finish sewing button as usual.

When making bloomer suits for the kiddies sew an extra pocket or two on the bloomer. When the suit comes to patching these pockets will match the rest as they will be laundered when the suit is.

Spread a big newspaper under the sewing machine to catch ravelings, bastings and scraps when you have a big job of sewing. This helps clean up after you are done.

If your sheets are wearing down the center, make pillow-slips of them. They are worth it.—Mabelle Robert.

The Discarded Pasteboard

DON'T burn pasteboard. Cut the sides away from boxes and save the large pieces which are used in packing. If packed together, they will occupy little space in the store-room.

A piece laid under the garbage can will protect the floor. The small pieces may be used on the shelves to set the tea and coffee pots on. This protects the shelf paper. A larger piece kept on the back part of the stove or on the work table will serve to set the black kettles on. All of the above may be quickly replaced when they become soiled.

A circle cut from a piece of clean white pasteboard will make a good covering for the stove-pipe hole in the summer. Another circle cut from heavy pasteboard over which is laid a linen doily will give every appearance of the asbestos mat. This is well for the busy housewife who has little time for crocheting. Children will play for hours with small squares of pasteboard. More interest will be shown if the letters and figures are written on them with colored crayons. If the overshoes and rubbers are set on a piece of pasteboard it will save much cleaning.—E. B. G.

When the rubber heels run over have the shoemaker remove them and replace them on the other shoe. This will double the wearing qualities.

A. A. Pattern Service

SPRING really is here now, though there is sometimes a nip in the air, and a spring serge or light flannel dress is the thing for everyday. No. 2377 is a simple design made extremely stylish by embroidery in, say peasant blue and red, or dull gold braid on a navy or black material. It cuts in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 takes 3 3/4 yards of 40 inch material, with 4 1/2 yards of braid. Pattern, 12c. Hot iron transfer pattern No. 717, blue or yellow, 15c extra.

2377
Emb 717

THE mature figure is made more graceful by lines that lead the eye downward, and both the panel insert and side pleats add becomingness to No. 2023. Crepe, satin or spring suiting are adaptable to this design. No. 2023 cuts in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 takes 3 3/4 yards of 40 inch material, with 1 1/2 yards of 10 inch metallic ribbon and 6 yards of binding. Pattern, 12c.

2023

NEVER were printed silks more varied in design or more tempting in price. No. 2079 shows one way of using one of these gay spring patterns to brighten up a dark street suit. No. 2079 is suitable for any figure. It cuts in sizes 14 and 16 years, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 takes 1 1/2 yards of 46 inch material with 3 1/2 yards binding. Pattern, 12c.

2079

TO ORDER: Write name, address, pattern number and sizes clearly, enclose correct amount, preferably in stamps (coins often tear through an envelope and are lost) and send to Pattern Department, AMERICAN AGRICULTURIST, 461 Fourth Ave., New York City. The 1925 spring catalogue is the "best yet." But there is no increase in price. It is still ten cents, and just about the best ten cents worth of fashion guidance you can get. Add 5 2c stamps to your order now and ask to have one sent you.

Service Department

Home Work Problems Again—Other Service Questions

SELDOM a day goes by that the Service Bureau is not asked about the possibilities of buying a knitting machine from the various companies that advertise them, and making money by knitting with these machines at home. There are several of these manufacturers of knitting machines who are reliable and whose machine will do good work; but AMERICAN AGRICULTURIST sometime ago refused to take their advertising because as the usual thing the experience of people who invest in these machines is unsatisfactory. The success of the work depends upon the user of the machine, for the machines are very intricate and take an almost infinite amount of time and patience on the part of the user before one can become expert in their use.

A few people have made a success of the work and have earned some money at home during their spare time. A much larger number have become discouraged and have given up the proposition as a total loss. Most of the concerns refuse to accept the return of an unsatisfactory machine or refund the price of the machine in general therefore, that persons want to be very confident of their own patience and ability to stick to the proposition before putting their money into buying one of these knitting machines.

Look Out For This Company

WE have had a large number of complaints against the LaPark Seed and Plant Company at Lapark, Pennsylvania. Each of these complaints has been referred to the company, and not one of them has received any attention from them. This seed company has not even had the courtesy to reply to our letters.

We do not know that they are positively dishonest, but in view of the complaints which the company seems unwilling to adjust, we must advise our readers to buy their seeds elsewhere.

Compensation Law in Pennsylvania

I have been a reader of your paper for several years, and am writing for information concerning the case for compensation claim as follows:

On or about March 15, 1924, my father then working at The Lakeside Coal Company mine at Berwindale, Pennsylvania, as a blacksmith, had his arm hurt and has not been able to work since. The mine foreman did not make a report of this and as a result no compensation has been received. The case was before the referee twice. He said compensation would be paid but that has been six months or more and the case seems to be dropped.

Will you please advise if compensation could be collected or if you can get it for him.—A. W. B., Pennsylvania.

To us there seems to be no doubt of your father's right to compensation for his injury. His remedy is to make application to the company that employed him, and if payment is not forthcoming he should write to the Workman's Compensation Bureau at Harrisburg, informing that bureau of the accident and of the employer's refusal to pay.

What the Service Bureau Did in January

DURING the month of January, the AMERICAN AGRICULTURIST SERVICE Bureau received from our people a total of 415 letters asking for help and service of various kinds. These letters were acknowledged and the machinery put in motion immediately to adjust the various difficulties which were raised. During the month we collected for our subscribers a total of \$1,239.50. The following are the names and addresses of the people for whom money was collected:

Mr. P. H. Eckler, Jordonville, Herkimer County, N. Y.\$ 10.16
Mrs. M. Bindige, Johnsonville, Rensselaer County, N. Y. 5.00

Mr. W. K. Miller, Boonville, Oneida County, N. Y.	83.50
Mr. Thomas Parker, Bombay, Franklin County, N. Y.	213.72
Mrs. R. Gilser, Dalton, Livingston County, N. Y.	11.66
Mr. E. C. Morse, Milan, Bradford County, Pa.	1.10
Mrs. Chas. Delosh, No. Lawrence, St. Lawrence County, N. Y.	78.89
Mrs. Rosemary Brush, Arrow, Somerset County, Pa.	7.50
Joseph St. Louis, Canton, St. Lawrence County, N. Y.	76.76
Mr. Francis E. Nelson, Nyando, St. Lawrence County, N. Y.	91.95
Mrs. Stuart Deiter, Morris, Tioga County, Pa.	2.50
Mr. H. J. Whitaker, Nichols, Tioga County, N. Y.	25.00
Margaret Rafferty, Cochran, Crawford County, Pa.	2.00
Mr. F. J. Simmons, Burdett, Schuylar County, N. Y.	21.18
Mr. Theron L. Clark, Hermon, St. Lawrence County, N. Y.	10.45
Mr. Andrew Beattie, Massena, St. Lawrence County, N. Y.	491.30
Mrs. H. Henson, Elmer, Salem County, N. J.	28.00
Mrs. Anna Nally, Amenia, Dutchess County, N. J.	18.00
Mr. Lewis I. French, Newport, Cumberland County, N. J.	49.00
Total	\$1,239.50

The fact that the number of letters and claims received is constantly growing shows the confidence our readers have in this Service Bureau work. If you need help write us all the facts and we will try to help or tell you frankly that nothing can be done.

He Willed the Property Away

We have had your fine paper, the American Agriculturist in our home over fifteen years, and it is now a necessity. I am coming to you now with one of my problems.

An aged couple have a daughter who makes a home for them when they cannot longer live alone, on account of the wife's poor health. The wife and mother becomes ill and is a great sufferer in bed for more than two years. The daughter cares for her mother, giving her the loving care which money cannot buy, with no provision for recompense, except vague promises. The mother dies, the father still having the same home and expecting the same loving care, also having the property in his name at mother's death.

Suppose this father makes a will giving all of his property to another person, except just a small amount of \$50 to the daughter, what can the daughter do? How can she get some recompense for her services? Can she present a bill after his death to his executor, or must it be settled before his death?—Mrs. F. N., New York.

The ordinary procedure in the case suggested in your letter is to file a claim for services with the decedent's executor. Such claims are usually not allowed, and a law suit results.

Thereupon, the court considers the case, and a reasonable allowance may be made. However, it is best to have some agreement with the person who is being cared for, and to that end we suggest that you talk the matter over with him at an opportune time.

When the Wife is Insane

"Can a husband have a marriage annulled where the wife has been confined to an asylum for five years? Would he then be free to marry again? If a marriage can be annulled any information you can give me about the length of time it would take and probable cost would be welcome."—D. V., Wayne County, N. Y.

Unless one's wife was actually insane at the time of marriage, insanity is never ground for annulment. Some

LIZA—Did yuh try to git a job this mornin'?

RASTUS—Did Ah TRY? Honey, Ah was scairt of mah efforts.—LIFE.

States (for instance, Washington) have passed statutes entitling a party to a divorce where the other party is incurably insane.

We know of no such statute in New York, however, in which state the only ground for divorces is adultery. New York does have a statute known as the "Enoch Arden Law" which you probably have in mind. This statute permits one party to get a divorce where the other party has been absent and cannot be found for a period of five years. This statute will not, of course, be of any use to you.

The Pennsylvania Trespass Law

Will you let me know through the columns of American Agriculturist whether land used for farming and pasturing, or in other words your home farm, needs to be posted to keep hunters off. We are greatly pestered by hunters from the adjoining towns, shooting over our farms and among our cattle that go to get water in the wood pasture. Kindly let me know if I need to post my farm to keep trespassers off in Pennsylvania.—O. E. S.

This question was referred to the Pennsylvania State Department of Agriculture and the following is their answer:

Making it unlawful to trespass upon land posted as private property, and providing the penalty therefor.

Section 1. Be it enacted, etc., That from and after the passage of this act, it shall be unlawful for any person willfully to enter upon any land, within the limits of this Commonwealth, where the owner or owners of said land has caused to be prominently posted upon said land printed notices that the said land is private property, and warning all persons from trespassing thereon, and the penalties provided in this act.

Section 2. Every person violating the provision of this act shall be liable to a penalty of not exceeding ten dollars, together with the costs of prosecution to be recovered before any magistrate or justice of the peace, as fines and penalties are by law recoverable; and, in default of payment of said fine and costs, the party convicted shall be committed to the county jail of the proper county, for one day for each dollar of fine imposed.

Section 3. All penalties recovered under this act shall be paid to the school fund of the district in which the trespass was committed.

Approved—The 14th day of April, A. D. 1905.

SAMUEL W. PENNYPACKER.

Building And Loan Association

Could you tell me anything about the U. S. Building & Loan Association, U. S. National Bldg., Phila. Pa. Would it be a safe investment?—M. C., Pennsylvania.

As far as we can see the full paid shares in this building and loan association are good investments. It is our opinion, however, that buildings and loan associations are intended primarily for the regular saving of small sums rather for the investment of any considerable amount at any one time.

Certainly you cannot get more than 6% anywhere without sacrifice of quality. You can get 5¼% by buying Produce Bonds sold by the Prudence Company, 162 Remsen St., Brooklyn. These are high grade guaranteed real estate secured mortgage investments. M. C.,

Wylausing Pa.

The Pennsylvania law governing building and loan associations is not as strict as that of New York, New Jersey or Ct. I am now informed that this building loan association has been in business only about a year and that it loans on second mortgage. In view of these facts I would like to recall my endorsement and advise the inquirer accordingly.

GALVANIZED Corrugated ROOFING!

Freight Paid as Follows:
Freight charges prepaid in full on all orders of roofing from this advertisement at prices shown to Illinois, Indiana, Ohio, Wisconsin, Michigan and Iowa.
If your state is not included, proportionate differences in freight will be allowed or we will quote you upon receipt of your request.

PINE TREE SURGE

Grade "A" Milk At Less Cost Than Dirty Milk

Earn the high premiums paid for Grade "A" milk. Yet make your milk at less than the cost of producing the high count, "smelly" milk that is barred from most city markets, Swiss Cheese Factories, and every other place where pure, clean milk is demanded. You can do it with the Pine Tree Surge Milker. We absolutely GUARANTEE it.

Only 4 Pieces of Rubber to Wash

We can guarantee clean milk with the Surge because it is so easy to wash that any man can keep it clean without wasting all the time he has saved by machine milking.

There are no long tubes to breed bacteria. Just the four teat cup inflations to wash. No claws to cause trouble. Just the simple pail and lid.

The Surge can be taken apart—washed *clean*—and put away in less time than you would spend getting any other milker ready for washing.

The Surging Action Milks Better

See it "Surge" and you will realize that here is an entirely new idea in machine milking. It milks cleaner and quicker—milks cows no other machine can milk. It leaves the teats and udders in perfect condition—always. The *surging action* does it.

Many breeders who never before allowed a milking machine on their cows, are now enthusiastic users of the Surge. We can prove to you, just as we did to them, that this wonderful method has positively revolutionized machine milking. Don't buy any milker until you see what a wonderful job of milking the Surge will do.

If you want more profit from your cows MAIL THIS COUPON!

If you are already selling your milk at premium prices, we will show you how you can cut your labor production cost in *half*. If you are selling at the ordinary market price, we will show you how to make milk that will bring top premium prices. At the same time we will prove that the Surge will cut your production cost, whether you are now milking by hand or with one of the old type claw machines.

You complain that your cows are not making the profit they ought to. Here is your chance to find out how you can cut the cost of production—and sell for a higher price at the same time.

We don't ask you to buy anything on mere claims. We stand ready to PROVE every statement made in this advertisement. All you have to do is to mail the coupon. It does not obligate you to anything. All it does is to tell us that you are interested. The rest is "up to us". Will you mail that coupon right now? If you really want to make more money out of your cows, you will do it.

Easy Terms

Any man who wants to buy a Pine Tree Surge Outfit after our free demonstration, can make a deal to pay for it on very easy terms. We'll figure with you to keep the cost down by using any equipment you may have already installed in your barn. You'll be surprised how little it'll amount to. Fill in the coupon and mail it right now. It doesn't obligate you to do a thing but listen to the proposition we have ready to make you. Mail coupon now!

The Farm Labor Situation

Some Of The Reasons Why Farm Wages Are Still High

Editors' Note: In reading this most excellent and interesting article on the farm labor situation, it should be borne in mind that the facts outlined are average for the country as a whole and that local factors may influence farm wages either upward or downward from these national conditions outlined by Mr. Gusler.

THE tendency toward increased employment in industry, road building and construction work points to a stronger competition for farm labor during the spring and summer of 1925 than prevailed during 1924. Somewhat higher wages will probably be paid for farm labor as a result.

Such are the conclusions of the economists and farm specialists of the United States Department of Agriculture. They might have added, also, that farm wages may be influenced by stronger competitive bidding among farmers themselves because of the improved agricultural outlook. The cumulative effect of the abnormal drift of population from the farm to the city during the last three years might be listed as another element in the situation.

This will be the third successive year that the hired man has had his wages raised. The price of farm labor reached the low point of recent years in 1922, when the average wage without board throughout the United States was \$41.79 a month. By 1924, it has risen to approximately \$47.50. If the forecast for 1925 proves to be correct, an average wage of around \$50 a month would appear probable.

Wage and Income Declines Not in Proportion

The halcyon days of the hired man were back in 1920 when monthly wages without board averaged \$64.95. The advance since 1922 still falls materially short of the peak but compares with \$27.50 in 1910.

Farm wages did not decline in proportion with the shrinkage in the farmer's income during the deflation period. Even at the low point in 1922, farm wages were 142 per cent. over the average from 1910 to 1914, whereas the farmer's income was almost annihilated. The rally in wages from 1922 to 1924 lifted them to 167 per cent. over prewar. Wholesale prices of farm products which are a fair yardstick of changes in gross farm income, averaged only 34 per cent. over prewar.

Everybody knows that it takes a larger quantity of farm products to pay the hired help than it formerly did. Using the figures just given, it took 25 per cent. more in 1924 than the average from 1910 to 1914.

On the other hand, farm wages did not rise as rapidly as farm prices in the early years of the war period. The farmer had the advantage from 1917 to 1919 as is shown on the accompanying chart. It is always true that wages rise and fall less rapidly than prices, although farm wages respond much more promptly than city wages.

By GILBERT GUSLER

Farm wages are influenced by wages paid to industrial workers. This is particularly true on farms near the industrial centers where workers can shift easily. Truck farming and dairying predominate in these districts. Both types of farming require a relatively large amount of hand labor, so that farmers in such areas are at a great handicap in times of industrial activity.

On the accompanying chart are shown the trend of wages of city labor as represented by union scales per hour. City wages continued to advance up to 1921, the decline in 1922 was

United States Department of Agriculture show that an average hired man's family in Iowa expended \$842.40 for purchased items and received from the farm, food, and rent valued at \$598.10, or a total of \$1431.50. In Ohio, items purchased amounted to \$764.50 and items furnished by the farm, \$478.80, a total of \$1243.30. In Alabama, croppers' families spent \$342.30, and received \$476.70 from the farm making a total of \$819.

The union wage scale in 1924, referred to in the foregoing would give an income of \$205 a month. This is high compared with an average money income of \$47.50 a month, or \$570 a year, for farm labor. House rent and food furnished to the farm laborer narrow the difference materially. In addition the union wage scales include many skilled trades where the artisan has served a more or less extended apprenticeship.

A Farm Management Problem

Improvement in the farm labor situation is largely a farm management problem. Slackening demand for industrial labor will release more workers for the farm temporarily. But, we are becoming more and more an industrial nation, and with industrial wages already higher than farm wages, the major trend of farm wages in the next few years will probably be upward.

It is well established that steadier work through the year, resulting from diversification of crops and live stock production make it possible to hire better help at a slightly lower average rate than where year round employment is not assured. Better housing also is a means of attracting and holding better farm workers.

The farmer's complaint that so much of the farm labor is inefficient is largely a matter for the farmer himself to change. Greater discrimination in wage rates between skilled and unskilled workers should help to develop the craftsmanship which the farmer claims that so much of the hired help does not have.

Occasionally, it is urged that restrictions on immigration should be removed in order to increase the supply and lower the cost of farm labor. This is a step toward a lower standard of living among farm laborers and toward less desirable rural community life. It seems to come most frequently from industrial leaders whose primary interest is in cheaper factory workers.

Farm Machinery to Fill the Breach

Modern farm machinery has greatly reduced the labor required on the average farm as compared with a century ago. Will the next hundred years see equal progress? Perhaps not, but some progress there will be. Perhaps the farmer must look in that direction for relief. Certainly, in times such as the present when farm wages are so high, the farmer

(Continued on page 309)

TREND OF FARM AND CITY WAGES AND FARM PRICES

Farm wages for male farm labor per month without board, city wages are union wage scales per hour and prices are the index numbers of all groups of farm products.

of very small proportions and since 1922 they have gone higher than ever. Wage scales of non-union labor probably would not show such stability.

Union wage scales in 1924 were 133 per cent. higher than the average from 1910 to 1914 while farm wages were only 67 per cent. higher. In short, while the hired hand has not had quite such a hard lot as the farmer himself, he has shared to some extent in the farmer's adversity.

A Comparison of Living Costs

Of course, the perquisites of the hired man such as house rent and garden, frequently furnished as a part of the pay, have been as generous as ever. These provide a substantial share of the living and are to be counted as a part of the income of hired labor. The urban worker, on the other hand, has had to pay greatly increased rent so that he is not as well off relatively as he appears to be.

These items are quite important in the aggregate. Surveys of the cost of living in farming communities made over a year ago by the

VOL. 115 March 21, 1925 No. 12

A Brief Glance at the Farm Situation

General Conditions

There seems to be considerable demand on the part of our folks for these general summaries that we print on the editorial page from time to time on the farm and market situation. Of course, they have to be short, but they are supplemented by our regular market page and by many articles which we are constantly publishing on the outlook for the different farm enterprises. The material is based upon careful study of many different sources of information, but chief credit should be given to the "Agricultural Situation" published by the United States Department of Agriculture.

In the dairy country, farmers have been doing the chores and in making the annual ice harvest with which to produce good milk during the coming warm season. Cold weather gave plenty of opportunity to get good quality ice. Getting up the year's supply of wood is also a tedious winter job.

In the orchards men have been busy with the pruning as weather permitted. Last week Mr. Herschel Jones reviewed the market situation in apples and each week Mr. Burritt comments upon the day to day work and problems of the fruit growers so we need not discuss this end of the farm business farther here.

In general, manufacturers report that farmers are buying more and that the somewhat better prices for farm products are beginning to show in the farmers demand for increased supplies with which to run their business.

City Prosperity

Activity in the cities is on the increase; the building boom is still going on; railroads are continuing heavy purchases of materials. The general price level for all products is upward. This means that prices of products which farmers buy will not be reduced, but on the other hand, it helps the market for farm products.

High Grain Markets

Grain prices, particularly of wheat and corn, are results of the very heavy world and national demand. Dairy men have felt this in the increasing prices of feed, but on the other hand, the grain growers—and there are many of them in the East as well as in the West—have been greatly benefitted. There is little

or no assurance that the high grain prices will continue for another year.

Hog Crop Short

One of the direct results of the short corn crop is a reduction in last year's total pig crop of 19 per cent, with around 20 per cent still fewer sows to farrow this spring than last spring. It certainly looks like the right time to raise some hogs, if the farm conditions are right.

Potatoes and Cabbage

Prices of potatoes advanced slightly and of cabbage very markedly for a short period. However, this was only a temporary spurt and prices are down again. There was an overproduction of both crops.

Poultry Products

The scare over the poultry disease has injured the poultry trade. Not only has the free movement of poultry been interfered with by embargoes, but the publicity given to this matter has caused a falling off in demand for both dressed and live poultry. There has also been an accumulation of poultry in storage, all of which, of course, affected prices during the winter. The demand now is good for quality stuff.

The egg market has been very satisfactory. Receipts during most of the winter were below last year, and the price level has been above. Storage stocks of eggs are considerably below those of last year and a little below the five-year average. The poultry business therefore continues to hold its own. Of course the spring lay has brought the usual seasonal drop.

The Dairy Market

Dairymen have a somewhat serious situation in the large stocks of butter in storage. Wholesale markets have generally felt the strain of excessive supplies of butter, both fresh and storage, and in spite of quite drastic price reductions these stocks have moved slowly. New Zealand butter has also been a small factor during the winter. As a matter of interest also Siberia is placing some butter on our market. It looks now as if we were going into the new season with a large storage of butter on hand, although market experts report that the butter market and demand are much more hopeful at this writing (middle of March).

In contrast to the butter situation, the market for condensed milk and cheese is good. There have been heavy reductions of storage stocks and other activities in the market which make the outlook for these two products very favorable.

Fluid Milk Market

It may be said that the outlook for the fluid milk market this spring is very fair and much better than it was last year. There has been an active demand for fluid milk throughout the winter months. The platform price has been pretty much maintained by all parties, without cutting, and it would seem that producers of fluid milk of good quality are going to have a much better year than they did last. The Dairy men's League Cooperative Association's change in policy in acquiring a fluid market is also without doubt a factor in strengthening the position of producers of milk for the fluid market and in stabilizing the market. It has been dairy market history that prices for milk immediately begin to decline after the first of the year. This year, however, the League has maintained its prices without reduction for the first three months and other organizations have followed this lead.

Ideal Wife Letters Next Week

HERE'S where we have to go back on a promise. Last week, we promised to run the prize winning letters this week on the subject "My Ideal Wife." Unfortunately,

these extremely interesting letters got crowded out this week, but you can surely look for them next time—and we think they are worth looking for.

Maple Sap Time

THERE is a certain romance of the seasons that no one can appreciate quite as much as the farmer. We people of the North Temperate Zone, particularly farm people, have much to contend with in the changeable weather, but it is very doubtful if many of us would give up the change and variety that come from the passing seasons for the most beautiful year-around sunshine of California or other southern climes.

The greatest and the best of these changes perhaps is the coming of springtime, the gradual lengthening days, the glorious spring light of the West at eventide; the greening up of the old meadows and pastures, the coming of the birds, and the annual mysterious flow of the sap from the roots to the branches.

We are saddened when we think of the passing of the beautiful old maple groves which are so rapidly disappearing. The making of maple syrup and sugar has always been the first big outdoors job of the year. It signifies the coming of spring, of new life and new hope and endeavor. He who has never known the joy of tapping an old maple and watching the sap start, or boiled it down in the steaming and odorous gloom of the old sugar house, or had a good old-fashioned stomachache from eating too much of the delicious new syrup, has missed a real and worthwhile experience.

Eastman's Chestnuts

TELL these to your minister. He will appreciate both of them. Somebody wrote me, or told me a story about the late President Wilson's father, who was a Presbyterian minister.

He was driving along a road one time with his fine white horse shining from a good brushing, while he himself wore some old clothes. After a time, he met one of his parishioners, who called out to him jokingly:

"Hey there, parson, your horse looks better groomed than you do."

"Easily explained, easily explained," replied the old man. "I GROOM THE HORSE AND MY CONGREGATION GROOMS ME!"

The best one of this kind that I have heard in quite a while, I got over the radio the other night.

By the way, let me stop to say if you can buy, borrow, steal, or manufacture a radio, you will miss out if you don't do it. I do not want to make too extreme a statement, but in my humble opinion, the radio is the greatest invention yet.

Well, to get back to my story, a railroad contractor advertised for two hundred and fifty sleepers, and the next day after his advertisement appeared, he received a telegram from a country minister which read:

"SEND SHIPPING DIRECTIONS AND I WILL SHIP YOU MY WHOLE CONGREGATION!"

Quotations Worth While

If you intend to go to work, there is no better place to start than right where you are.—Abraham Lincoln.

Working to Reduce the Land Tax

Legislators Reply to A. A. Request for Relief

AS a part of the campaign which AMERICAN AGRICULTURIST is carrying on to get some relief from the heavy tax burden on farmers, we wired or wrote the following letter to every member of the New York State Legislature:

News dispatches indicate that there is a tendency on the part of the Legislature to lose sight of the paramount need of reducing or eliminating entirely the direct state tax on real estate.

American Agriculturist has 20,000 letters on file from farmers that there should be no further income tax reduction until farmers are relieved of this burdensome and incorrect principle of direct taxation of real estate.

We earnestly call your attention to the impoverished condition of the thousands of New York State farmers and their absolute need of your help in reducing their tax burden.

AMERICAN AGRICULTURIST
HENRY MORGENTHAU, JR., Publisher.
E. R. EASTMAN, Editor.

Here are some of the replies we received:

Hon. Seymour Lowman, Lieutenant Governor:

"Your telegram is received. We are making the biggest fight we can for our farming communities. Some way a New York City element seems to prevail in the papers. Unless we do something for the farmers soon you are going to see rapid abandonment of this class of property."

Senator J. G. Webb, Chairman, Committee on Military Affairs:

"I have your letter of February 28th, in regard to the reduction of the direct state tax on real estate.

"You may rest assured that I am absolutely in sympathy with this measure and intend to do everything possible to see that a reduction is made this year."

Senator Thomas C. Brown, Chairman, Committee on Penal Institutions:

"Replying to your letter of the 28th, I agree with the sentiments expressed therein and my influence will be used in the direction indicated."

Senator Leigh G. Kirkland, Chairman, Committee on Agriculture:

"I regret very much that this question is so controversial as to whether we shall commit ourselves to an annual 25% cut in income tax or expend all of our effort in an attempt to abolish the real property tax in this state. I am a firm believer that every effort should be made to abolish the real property tax, before lowering or reducing taxes on personal income. As you well know, there is an attempt to do both this year.

"I feel that there is decided sentiment among many of our legislators to agree with me in this matter. I think you will also appreciate that the press generally is supporting an income tax cut and ignoring entirely the question of any relief upon real property.

"Many of us had felt that this additional state aid for schools could be taken care of to quite a degree by the difference in the income to the state provided there was no cut in in-

come tax this year.

"Should there be a cut in the income tax, we have got to hunt for new sources of revenue to take care of this additional state aid. Of course, one of the objects of this additional state aid is to help relieve real property tax in our rural dis-

come tax until the direct tax on real estate is wiped out. I am in entire sympathy with the position outlined in your letter.

"As I understand the attitude of Governor Smith, he wishes to postpone certain appropriations until next year; that is postpone the payment of them in order to make good on the 25% income tax reduction.

"There seems to be some danger of the defeat of our bills for increased public money for the schools, which will take about ten million dollars additional money and materially aid rural sections. It seems to me that the school taxations are one of the greatest burdens the farmers have, and that it would be much better to use this ten million dollars to reduce school taxes rather than to reduce the income tax.

"I will be glad to receive any suggestions you may have on the subject."

* * *

Senator Thomas J. Walsh:

"I have your letter of February 28th, in which you ask that I make every effort to reduce the direct state tax on real estate. I am heartily in accord with you and shall do everything in my power to carry out your wishes in the matter.

* * *

"I thank you for your expression of views."

Senator William Lathrop Love:

"Your letter received. I was glad to hear from you and will look into the matter carefully."

* * *

Assemblyman Simon L. Adler, Leader of the Majority:

"I have your letter of February 28th on the question of the reduction of the state tax on real estate. This matter is having our consideration and I am glad to have your opinion of it."

* * *

Assemblyman Bert Lord:

"I received yours in regard to taxation and am taking this up with Ways and Means this afternoon. You may rest assured that I will do everything possible for the relief of the agricultural interests.

"I thank you for calling my attention to this."

* * *

Assemblyman F. Trubee Davison, Chairman, Committee on Taxation and Retrenchment:

"I was very much interested in your letter of February 28th in regard to abolishing the direct state tax.

"I may say that I completely concur in your point of view and only hope it will be possible to accomplish it."

* * *

Assemblyman Daniel P. Witter, Chairman, Committee on Agriculture:

"I appreciate what you say in this letter and assure you that I am in hearty accord with your letter. I shall do all I can to defeat any reduction in the income tax and give any relief that may be possible along the line of tax reduction to the tax on real estate."

* * *

Assemblyman Robert A. Catchpole:

"Received your favor of February 28th, and wish to assure you that I am heartily in favor of anything that will tend to reduce the tax on real estate for I am sure such tax on real estate has reached its limit."

Continued on Page 310

Your Legislators Appreciate Support

FOR weeks there has been a big fight in Albany over the question of the State's finances for running the government this year and whether or not taxes should be reduced. Those who represent the city interests have been strong for the reduction of the income tax. Those who realize what the ruinous taxes are doing to farming have been fighting to get a reduction of the direct state tax on real estate.

American Agriculturist has several times brought to the attention of the leaders in Albany the sad plight of farmers because of taxes and the absolute necessity for some relief. In doing this, we have been supported by the thousands of letters which farm people have written us on this subject.

The State Government has a difficult task in trying to work out this problem because of the constantly increasing amount of money needed to take care of the State's needs. Not the least of these is an extra appropriation of nine million dollars which would go to farm people for more direct state aid of the rural schools.

On February 28th, it seemed that a crisis was approaching in Albany when a decision on the reduction of income taxes was about to be made. At that time, therefore, we wrote the letter which appears on this page to every member of the legislature and to the Governor. A decision in the matter has not been reached, but we feel that the response which we received from the Senators and Assemblymen whose letters appear on this page show that they are doing what they can with this difficult problem, and that they appreciate our support, and particularly yours.

tracts. You may rest assured that I will do anything I can in support of any relief for real property as regards taxation."

* * *

Senator Arthur F. Bouton, Chairman, Committee on Insurance:

"Receipt is acknowledged of your letter of February 28th, objecting to the reduction of the in-

The weak link in muck soils

The strength of a chain depends upon the strength of each link. When one link is weak, the whole chain is weak. Likewise, the fertility of your soil depends upon each of the essential plant foods.

Potash—and sometimes phosphoric acid—is the weak link in muck soil. To produce good crops on muck soil apply plenty of potash.

In Seneca County, New York, Mr. M. C. Cook grew potatoes on three adjoining plots. The soil was black muck. His yields showed that 600 lbs. per acre of an 0-8-24 mixture resulted in \$53.04 more income than when the same fertilizer minus potash was used. In other words—

Mr. Cook's experiment with potatoes on muck soil showed that potash costing \$8.44 produced \$44.60 extra net income per acre.

Experiment stations are recommending the use of 1000 to 1500 lbs. per acre of mixtures analyzing from 10 to 24% potash for muck soils.

When Handled Right There is Money in Them

LET us consider the proposition of cantaloupe grow-

By H. J. WALRATH

ing from two sides—the commercial and the production. In discussing the production of any commodity, it should first be decided whether it is sufficiently profitable from the commercial viewpoint to warrant the continuance, or extension, of this production.

From this commercial viewpoint, there is much reason for stating that there are many food crops which do not justify their continued production on the present scale. It would be a great benefit to the body of vegetable and fruit growers as a whole if some would discontinue or greatly reduce their production of certain crops. We must recognize and be governed by this state of affairs, even though it involves crops which, from a producers standpoint, we enjoy raising. It is very well for an amateur gardener to raise the crops he prefers to work with, regardless of their market value. But the professional grower, who must receive some profit over his investment if he is to survive, must choose according to the prospect of profit.

We Import 'Loupes From Other States

The question now is: does cantaloupe growing offer a good enough average profit to make it a desirable crop to raise commercially in this section, and will it permit of any extension as a local market crop without over-stocking the market?

To my mind, one of the strongest answers to this question lies in the fact that this part of the country imports yearly thousands of carloads of cantaloupe shipped from California and other distant states. This condition exists everywhere in the section east of the Mississippi and north of the Ohio rivers, or in other words, the most heavily populated part of the United States. The first of these importations come ahead of the local season, but the crated cantaloupe continue to be shipped in as long as the season lasts, in spite of the admissions of the retail dealers that the greater part of them are flavorless.

In the larger cities, there are so few home-grown melons in the market, compared with the quantity of the imported ones, that very few of the city people have ever had a chance to eat those of local origin. Even in the small towns the crated melons are to be found throughout the season. The dealers claim that the supply of home raised melons is too small for the trade, even in the rural towns. Of course these conditions may vary in different localities, but in general this situation is in-effect.

Must Avoid "Glut" Period

Now this condition exists in spite of the fact that the average local grower of cantaloupe brings to market a product so greatly superior to the imported stock that the trade will not accept the crated melons, in spite of their fair external appearance, if they can get the home product. It has even become the custom of some dealers in our locality to re-pack the crated melons in the style of basket used by the local growers, to create the impression that they are of local origin. All this proves that the imported cantaloupe are bought, not because they are superior to the local melons, or even equal to them, but entirely because the supply of the local melons is too small for the demand.

It must be admitted, however, that there usually comes a time, in a season of favorable weather, when there is a temporary crowding of the melon market. This is due to several causes, sometimes all in combination at once. One factor is the arrival on the market of the later varieties of cantaloupe, which have been gradually arriving at maturity while the earlier kinds were enjoying sales at good prices. The fact that these earlier sorts are not yet finished in their output gives a much larger

supply than before. Also, the distributors of the imported mel-

ons may have begun to have stocks piled up on their hands, due to heavy shipments and slower sales due to competition of the local melons, and they begin to cut loose from their stock at slashed prices in order to avoid a dead loss. At such times dealers often report that the trade is not buying as keenly as before; they have had cantaloupe for some weeks, and while they still buy, they are slower in buying, and more cautious as to quality and price.

Study of Varieties Necessary

This is the logical result of such conditions, but it can be largely avoided by local growers who use judgment and foresight. This situation does not usually last very long, as the supply of the earlier varieties diminishes, and the cooler weather of the later season ripens all melons more slowly. The way to avoid such market congestion is for the local growers to plant more extensively to varieties better adapted to their local conditions. Too many are trying to compete with the California growers with their own type of cantaloupe, which may be just right for a semi-tropical climate.

But in this climate, many of these varieties barely succeed in getting into the market at the latter part of the season here in a good year, and fail to ripen any fruit at all in such years as the last two have been. Some growers are suffering from their delusion that these late varieties are of superior quality, which is not necessarily the case, as there are some varieties which are suited to the needs of the local grower which are fully the equal of any of the late varieties in quality. Other men stick to some old favorites through force of habit regardless of their being unprofitable. Still others waste their efforts by experimenting with many varieties, year after year, when they should know from the seed catalog description that most of these kinds are not fitted to their needs where a short growing season is the rule.

Concentrate on Few Varieties

It is my experience, and that of many successful growers with whom I have talked or corresponded, that it pays best to concentrate our efforts on few varieties of proved merit. The matter of earliness is one of the greatest, if not the greatest, factor to be considered. The early melon practically always has the earliest weather in which to ripen, and no melon can develop its best flavor in cold weather.

The public is most eager to buy in the early season, and will pay high prices. The main part of the crop is sold at a good profit before the late varieties arrive, and if a market surplus comes, it need not worry the grower of the early melon as it must worry the man whose crop has just begun to get ripe. We have found it most profitable to specialize on one variety, and have our profit stowed away before the late varieties begin.

Sell Only Superior Melons

In spite of the fact that in general the home ripened melons are so much superior to the shipped stock, yet we all realize that there are some growers who hurt the reputation of the home product by marketing very inferior stock. These are the men who bring in their product without grading, just as they come from the field, some over-ripe, some forced off green vines, some mis-shapen, and unfit to eat.

Some of these men may have only a small patch, and their total production may be very little; by selling cheaply they will, probably get rid of their few baskets. Some one will buy them and try to eat them, and the reputation of home-grown melons will suffer, although it would seem that no one could expect anything good from melons of this sort.

UNION CARBIDE

works wonders
for every
farmer

UNION CARBIDE GAS, properly combined with oxygen, is the modern metal surgeon—the Oxy-Acetylene Welding Process. It makes possible quick, permanent and inexpensive repairs of damaged machinery. Any metal part which is broken can be made as good as new.

Long, vexatious delays in getting replacement parts are no longer necessary.

Every farmer should learn at once the location of the nearest shop equipped to weld and repair metal parts by the Union Carbide Gas and Oxygen Process. This process has completely revolutionized the repair of metals.

There is no necessity for scrap-

ping costly machine or implement parts because of breakage. A welded part is as strong or stronger than a new one—and the cost is trifling. There is no delay, no enforced idleness. Everything of metal can be repaired. Metal parts are remade while you wait. Large and heavy equipment can usually be welded in place, often without dismantling the machinery.

Planting and harvest season delays and worries can be minimized. Money, time and worry can be saved.

The development of the Union Carbide Gas and Oxygen Process for welding and cutting metals is conceded to be an outstanding achievement of the century.

What Are the Best Varieties of Grapes?

I intend to plant one acre of grapes. What will be the best and sweetest varieties. I do not know anything about grapes. —W. B. V., New York.

ON account of our not knowing just the type of market you expect to cater to, it is a little difficult for me to advise you definitely regarding varieties.

On our farm there are thirty-two acres of grapes. For a white grape I find the Niagara the most satisfactory from a market standpoint. It is a fine table grape. It is, however, rather susceptible to disease and is not as heavy a bearer as the Concord. The standard blue grape in New York State is the Concord. As a general market grape I do not think there is any better variety unless it be the new one known as the Sheridan which has recently been developed by the Experiment Station. I understand this grape ripens about with the Concord and in some ways is supposed to be superior to it.

No Red Grape Like Delaware

If you want a blue grape which is earlier than the Concord I would suggest the Worden. The berries are larger than the Concord and more tender. It will not stand shipping so well. If you are interested in an early red grape there is probably no better one than the Delaware. It is a very attractive grape with compact clusters made up of small berries. It is a pretty red in color. If you are looking for a late red grape I would recommend the Catawba.

I would suggest that you make your rows 9 feet apart. The vines in the row should be probably 6 feet apart. A variety growing as vigorous as the Concord needs this amount of space. Some of the less vigorous growers might be set 7 feet in the row provided you are planning to use a system of pruning which cuts the vines back heavily each year.

It is best that you buy No. 1, one year old plants and get them set as early in the spring as good cultural conditions will permit.

You will find it worth while to write the Geneva Experiment Station for several bulletins they have on "grape culture." There are two in particular, one which describes the various systems of pruning and another describing some of the varieties recently developed which show outstanding qualities.—Jay Coryell.

Raspberry Bushes Must Be Inspected and Certified

I have heard that it is necessary to have any kind of berry sets inspected before you could sell them to any one. I saw in the Lyons Republican that they had to be inspected. I have some berry sets to sell and I would like to know—G. T., New York.

This question was referred to the New York State Department of Farms and Markets. George G. Atwood, Director

Kelly Bros. Nurseries
1130 Cherry Street
Danville, N. Y.
Established in 1880

"In response to your communication of the 10th inst. on the subject of raspberry inspection, I enclose you a copy of our Quarantine Order relative to the control of raspberry diseases. The regulations under this order provide that growing plants must be inspected in the summer (July and August) and the beds thoroughly cleaned from mosaic-diseased plants. If at the second inspection they are found free from disease, the plants are certified for shipment.

"You do not give the location of your plants or on what farm they could have been found last year. We will be glad to have this information; then I can tell you whether our inspectors last summer found your plantations for inspection.

"In the event you cannot, under these conditions, receive certification for your plants for spring shipping, please advise us fully as early as the middle of June the location of your plants and we will be glad to arrange certification.

The official quarantine notice is as follows:

WHEREAS, Dangerously injurious diseases infecting the raspberry commonly known as Mosaic, Leaf-curl and Rosette (or Eastern Blue Stem) have been found widely distributed in New York and other states,

NOW, THEREFORE, for the purpose of preventing the introduction and spread of these dangerously infectious diseases, I, Berne A. Pyrke, as Commissioner of Farms and Markets of the State of New York, by virtue of the power and authority conferred and the duty imposed upon me as such Commissioner of Farms and Markets, hereby forbid the bringing into the State of New York from any outside point whatever, of any raspberry plants (roots or tips) except only under regulations issued by this Department covering plants from other states where adequate measures are enforced for preventing the spread of these diseases, and certificates issued showing relative freedom from the said diseases.

FURTHERMORE, it is hereby ordered that no raspberry plants (tips or roots) shall be sold, shipped or transported from any nursery, field or plantation within this State except only from such places as have been properly inspected and certified, under regulations issued by the Department of Statically free from disease, and accompanied by an authorized certificate of inspection issued by the Department of Farms and Markets.

All persons in the State of New York who desire to propagate plants of raspberries for sale must make application for inspection and certification prior to June 15, 1924, and must comply with the orders of the Commissioner or his agents, and no certificate shall be issued for the sale or transportation of plants not grown under these regulations.—BERNE A. PYRKE, Commissioner of Farms and Markets.

The Farm Labor Situation

(Continued from page 303)

would do well to consider what could be done to reduce his hired labor requirements by replanting his farm equipment. Greater attention to the layout of buildings and fields than has usually been paid in the past is imperative under conditions which promise to prevail in the future.

According to records of the Department of Agriculture, total wages to hired labor paid by farmers in the United States are about \$1,200,000,000 annually. This is equal to about 10 per cent of the gross agricultural income. Less than half of the farms employ hired labor efficiency materially is well worth for the employing farms. Any change in farm practice or in equipment which would reduce the labor cost or raise the labor efficiency materially is well worth while.

Cantaloupe Possibilities

Continued from page 306

For this reason, it will pay every grower to use care and judgment in sorting and grading melons for the market. If he does so, his customers will find that his cantaloupe can be depended upon to be of good quality and he can build up a permanent list of steady customers. This is much more profitable than selling in a haphazard way, without any regularity in supplying the trade, and much better than selling to a

Seed Right-for Greater Grain Profits!

Plant Safely-with FARMERS' FAVORITE

WITH the Farmers' Favorite Grain Drill every seed gets an even start. Properly

spaced to the fraction of an inch—in roomy trenches uniformly covered—all seeds sown by the Farmers' Favorite grain Drill have their full chance for proper germination and sturdy growth. No bunching, no skipping. No idle soil to cut your profits.

FARMERS' FAVORITE Grain Drills

have been the world's standard for more than a half-century. *Farmers' Favorite quality is as staple as wheat itself.* And here is the reason: While these dependable drills are, above all else, precision tools, primarily designed for remarkable planting accuracy, they are so thoroughly well built that they outwear practically all other farm implements. No other farm tool does more to insure farm profits—or costs so little through the year as a Farmers' Favorite Drill—or a Farmers' Favorite Seeding Machine for any planting need.

Black Hawk Manure Spreader

A Manure Spreader of superior quality. Scientifically designed and sturdily built. Has a strong and positive feed, does not choke and is free from cog gearing. *Get the full fertilizing value of the manure by using the New Black Hawk 40A.* It thoroughly pulverizes and spreads manure widely and evenly in a great range of quantities. Lightest draft, simplest construction, easiest to operate. A Two-horse Spreader. Does a perfect job on hill-sides and level ground. Write for full details.

Farmers' Favorite Lime Sower

For perfect spreading of Lime there is no better machine built than the *Farmers' Favorite Lime Sower*. Built low for easy loading. No cogs or gears to break or get out of order. Smooth, steady feed. Adjustable for spreading 300 to 6,000 pounds per acre. Sows damp lime as well as dry, without clogging. Handles all kinds of commercial fertilizer. Has a 10 bushel hopper capacity and can be used back of team or tractor. Mail coupon or write for details.

Get the whole story of Farmers' Favorite quality. Check on the coupon the implements you are interested in and we will send you circular and complete information.

Name _____

Address _____

wholesale distributor. While there are many wholesale produce men who mean to do well by their patrons on both sides, there are too many who will try to tempt the grower by offering to take his whole load at a cheap price, then using his cheap price to sell to the retailers at a price below what they had been paying direct to the growers. This operation will be repeated, at a lower price each time, soon crowding the price below the profit line. However, most growers of good melons are too wise to play into the hands of such dealers, who usually deal mostly with the weak ones who bring in the poor stock as before de-

scribed. The good retail dealer will prefer to buy direct from the better type of grower, even at a higher price, rather than to spoil his trade with poor melons.

Study Market Possibilities First

There is much more to be said in regard to the profitable marketing of melons, but some will doubtless feel that it is time to attend to the production end. I have put this much attention to the commercial side because it is self-evident that there is no use in being able to produce a fine large crop of cantaloupe unless he keeps the profits from the sales in his own hands,

and does not allow it all to go to the middlemen. I would emphasize the importance of looking into all prospects of the market, including stores, hotels, restaurants, etc., and by no means neglecting whatever opportunities may exist at the home farm or roadside stand, which in many localities is the means of profitably moving a large acreage. The same general rule applies to all markets—make your product uniformly good by careful grading, and you can build up a permanent trade of good prices, and make the impression firm on the buyers that home grown melons are the only ones to buy after the season has arrived.

Farming the Nation's Power Crop

GOOD SOIL alone won't grow a crop. It must be plowed and harrowed, seeded and cultivated.

This was the hard fact faced by a small group of men in Chicago forty years ago. Their soil was the future growth of America; the crop—electric service.

They knew that unless the best thought of the ablest men in the industry could be put at the service of all, it might never fulfill the high destiny they had hoped for it. Thus it was that these "farmers of power" founded the National Electric Light Association, as a voluntary organization of electric light and power companies. Concerned from the first with questions of economy in production and future development, the Association formed committees of experts, the result of whose research was published for the benefit of all members.

Today, representing ninety per cent of the nation's electric service, three hundred committees are engaged in studying the needs of their communities and the problems of the industry as a whole. In its cooperative program with the Farm Bureau Federation, National Grange, American Society of Agricultural Engineers, Power Farming Association, and the U. S. Departments of Agriculture, Commerce and the Interior, the National Electric Light Association is able to speak for a united industry engaged in working out a practical way of serving that larger group of "farmers" on whom the prosperity of the nation must always depend.

NATIONAL ELECTRIC LIGHT ASSOCIATION

Look for the extension roof

THAT'S how you can tell a Globe Silo. It is an exclusive feature and reduces cost per ton capacity. Spruce and fir, the best materials, make a Globe Silo last over a generation. Heavy matching walls, double splines, sealed joints and adjustable doors absolutely insure complete air-tightness. Increases value of farm. A Globe Silo lasts longest, is most profitable, most convenient. Write today for our catalog and price-list; silos, tanks, ensilage cutters, stanchions, etc.

Working To Reduce The Land Tax

(Continued from page 305)

Assemblyman Walter L. Pratt, *Chairman, Committee on Conservation*:

"Your favor of the 28th ult., regarding the need of reducing general property tax, at hand. I assure you that I am heartily in favor of it, and will do what I can to have a reduction made in the general property tax if any is made. Enclosed find copy of some figures which I have prepared which may be of interest to you."

* * *

Assemblyman Frank S. Hall, *Chairman, Committee on Social Welfare*:

"I received your letter in relation to introduction of the direct tax on real estate.

"I quite agree with you that there should not be any further reduction on income tax, until farmers are relieved of the heavy taxation that now exists on real estate. I have always been a farmer myself, and will be very glad to do what I can to get a tax bill passed that will benefit the farmer."

* * *

Assemblyman Fred L. Porter:

"I have your letter of February 28th which I assume was prompted by the Governor's proposal to reduce the income tax 25%. I doubt very much whether the Governor can consistently carry out this plan on account of the tremendous state obligations before us. I don't look for cutting the income tax this year. Neither do I expect a reduction in the direct state tax. Either one would mean that the state's surplus would be almost entirely exhausted.

"I am well aware of the improvised condition of the New York State farmers, and their absolute need of help in reducing their tax burden, but I can't see any immediate relief for them in view of the tremendous bond issue obligations which will have to be met in the next three years.

"I thank you for your expression on this matter."

* * *

Assemblyman John P. Hayes:

"Acknowledging your letter of February 28th relative to the paramount need of reducing or eliminating entirely the direct state tax on real estate, I assure you this will be given my careful consideration."

* * *

Assemblyman J. W. Yates:

"I have yours of the 28th ult., and you may rest assured that I will be very glad to do anything within my power to relieve the farmers, as much as possible, of the taxation burden."

* * *

Assemblyman Walter F. Clayton, *Chairman, Committee on Cities*:

"I beg to acknowledge receipt of yours of February 28th, and in reply, permit me to say that I am rather favorable to the proposition you have written me about and I will give this matter serious consideration."

* * *

Assemblyman Frank H. Lattin, *Chairman, Committee on Public Health*:

"I was opposed, at the session of 1924, to the 25% reduction on income tax, both at the conference of our party and in the Assembly when the same came before us. The income tax reduction last year made a return of five or six thousand dollars to my county while the surplus fund which made this tax permissible was derived from direct taxation on real property of which my county contributed twenty-five or thirty thousand dollars of the distribution through direct taxation on our farms and real estate. Therefore, I am still opposed to the 25% reduction on the income tax."

* * *

Assemblyman Russell G. Dunmore, *Chairman, Committee on Claims*:

"I assure you that I realize the attitude of the farmers on this proposition and am in sympathy with their attitude. Anything I can do to insure a reduction of the direct state tax, you may count upon me to do."

Better Cultivation in Field and Orchard

A Real Double Purpose Harrow. Gangs can be closed together for field work or extended for orchard cultivation. Gangs are reversible in either position.

Clark
"CUTAWAY"

Top-Dressing Meadows

And Other Early Season Crop Notes

NITRATE of soda proved to be the best source of nitrogen in a top-dressing fertilizer for mixed hay in a six-year test recently reported by the Rhode Island Agricultural Experiment Station at Kingston.

Among various tests with manures and fertilizers upon several crops, as described in the annual report of the director published last year, mixed hay for six continuous years has been top-dressed annually with different kinds of nitrogenous fertilizers. All plots have received acid phosphate equivalent to 75 pounds of phosphoric oxide (approximately 475 pounds of acid phosphate) per acre, and wood ashes equivalent to 50 pounds of potassium oxide, to provide the proper balance for the nitrogen.

The approximate amounts of nitrogenous dressings, together with the annual yields of hay per acre, have been as follows:

	Tons of Hay per Acre
Horse Stable Manure, 16 tons (4 cords)	2.94
Nitrate of Soda, *300 pounds	3.24
Nitrate of Soda, x150 pounds	2.76
*Equivalent to 25 lbs. Nitrogen per acre.	
*Equivalent to 50 lbs. Nitrogen per acre.	

These results show that 150 pounds of nitrate of soda was almost as good as 16 tons of manure in increasing the hay yields. Double this amount of nitrate gave about a quarter-ton more than the manure. Three hundred pounds of nitrate was good for half-ton increase over the 150-pound application.

These tests suggest that for the ordinary mixed hay fields in the east, that are in sod more than one year, one would not be far out of the way in top-dressing such meadows each spring at the following rate per acre:

150 to 200 pounds Nitrate of Soda
300 to 400 pounds Acid Phosphate
100 to 125 pounds Sulfate of Potash.

This is applied with a fertilizer spreader as soon as possible after the ground dries out and before the grass shows much growth. The earlier the better.

—C. R. WOODWARD.

Our Experience Shows It Pays To Use Good Seed Corn

WE have been growing corn for more than 50 years, therefore are in a fair position to know what constitutes good seed. As the season last year was cold, rainy and late, (especially in the East and South) causing very late plantings of corn of which a large percentage did not reach proper maturity, farmers should be very particular as to the seed they plant this season. It would be far wiser to pay \$3.50 or \$4.00 per bushel for guaranteed good seed rather than run a great risk with that you have of poor, inferior quality. Every grain of perfect corn has a tiny living germ, which has a great duty to perform. If the germ is imperfect, the whole grain is imperfect as far as coming forth and producing is concerned. If the germ is not of high germination it is impossible for the plant to grow, thrive and produce well.

The small corn plant starting out in a cool wet spring and often with very heavy rains or adverse conditions must be of a

vigorous, thrifty nature to succeed. Like a young pig or calf, the more thrifty the corn plant is born the quicker and the faster it will grow even under adverse conditions. Hence, as corn planting time is with us it is highly important that the seed be of high germinating strength as possible. With this in mind, good seed corn must have the following characteristics: (1) sound, plump, with white germs; (2) average size, well matured kernels (3) backs of kernels glossy and free from soft starch and blister; (4) both kernels and cob free from mould or discolorations; (5) kernels of good depth and of medium indentation.

In selecting good seed ears, we always shell off the tips and butts by hand and discard these kernels. We observe the weight and firmness of the ear. Ears of light weight are not used for seed, and the same goes for all ears showing evidence of mould on the kernels or cob.

We have always found it best to select seed corn in the field before the bulk of the crop is gathered; though a good many select from the crib just before planting, which is bad practice.—W. H. HARRISON.

Seeding Alfalfa in Northern Jersey

I have come to the conclusion that it will pay me to raise alfalfa. When is the best time to sow it and how much is used.—C. R. Y., New Jersey.

IN view of the fact that you are living in northern New Jersey, it seems to us that the spring sowing of alfalfa either in winter or spring grains is the cheapest and safest method of putting in the crop. Professor H. R. Cox, who is specialist in farm crops at the New Jersey State College of Agriculturist, is of this opinion, after having studied, many different combinations of methods.

According to Mr. Cox, field studies in northern Jersey show that it is usually best to seed alfalfa in a mixture with clover and grass, using anywhere from 2 to 6 quarts per acre. Of course, where alfalfa is sown in straight, it will usually take about 12 pounds. It is a mistake to sow the seed without inoculation. It is so easy to inoculate for alfalfa that there is no excuse for passing this by.

When you purchase your seed, make sure that you are getting a high quality product. Northern grown alfalfa is the best for your territory. Quality seed may cost a few dollars more but it is the best investment.

Avoid Low Ground for the Garden

LOW ground is sometimes selected for the garden because of the richness of the soil but it is a mistake. Frosts strike earlier in low places and also come later, and the cooler nights when the cold air settles down from higher ground delays growth. Higher ground is much better and we can enrich it as well, even hauling sand or using the coal ashes from which we sift the coarse material.—Rachel Rae.

"Hey! Woodman, spa-are that tree!"—Judge.

Exide Batteries

store the electric power in Delco-Light plants

IF it were not for the battery, you would have to run your farm plant engine every time you wanted to light a single light.

The power generated by the engine and dynamo is stored in the battery, ready for your instant use. An efficient battery conserves power, saves fuel, and makes light and power economical.

So vital is a good storage battery that Delco-Light has equipped every one of the 200,000 fine plants it has built, with Exide Batteries.

Exides are rugged, long-lived, and dependable. They are made by the largest manufacturers in the world of storage batteries for every purpose.

In purchasing a new battery for your plant, remember that the best battery is the cheapest in the end.

When you need another automobile battery, get a rugged, economical Exide. And don't forget the highly efficient Exide Radio Batteries.

CRAINE TRIPLE WALL SILOS

THE SILOS OF GIANT STRENGTH

Time Tested Windmill

The Auto-Oiled Aermotor has behind it a record of 10 years of successful operation. In all climates and under the severest conditions it has proven itself to be a real self-oiling windmill and a most reliable pumping machine.

An Auto-Oiled Aermotor, when once properly erected, needs no further attention except the annual oiling. There are no bolts or nuts to work loose and no delicate parts to get out of order.

There are no untried features in the Auto-Oiled Aermotor. The gears run in oil in the oil-tight, storm-proof gear case just as they did 10 years ago. Some refinements have been made, as experience has shown the possibility of improvement, but the original simplicity of design has been retained while greater perfection of operation has been achieved. The Aermotor is wonderfully efficient in the light winds, which are the prevailing ones. The self-oiled motor works with practically no friction, and the wind-wheel of the Aermotor is made to run in the lightest breeze. It is also amply strong to

run safely in the strongest winds. In any condition of wind or weather you may be sure that the Auto-Oiled Aermotor will give you the best of service. It is made by the company which established the steel windmill business 38 years ago.

With The Dairymen

What Are the Best Side Lines With the Dairy?

Here I am again after advice. Being in a dairying section, every farmer must have a dairy, I suppose. Still since coming here in 1920, I have tried not to make matters worse by producing more milk than I required for my customers. I am a milk distributor as well as a producer, and I always aimed at having sufficient veal valves to take care of the surplus I might get.

I have 140 acres of land possibly 80 acres of which have been ploughed and 60 acres in pasture, partly wooded and watered by a good size creek. You must know our section to some extent as some of your officers attend the State Fair and I would like to know either directly or through American Agriculturist what you would suggest as a means of increasing my earnings without harming the milk situation in the least. With my farm in good order, I could keep 35 to 40 cows. What else should I go into not to have more than 16 to 18 cows and get maximum earning from the farm?

If I could get a reliable man, I would like to keep more pigs, some sheep, have a few acres in strawberries, raspberries and vegetables. I do not consider that grain is a paying crop here; oats do not always grow good and I have known wheat (good winter wheat) to sell for less by the hundred pounds than we had to pay for plain wheat grain!—A. N. M., New York.

I AM very much interested in your letter of December 23, not only because I should like to help your personally, but because your problem is also the problem of most other farmers. Although I have had long years of practical farm experience myself, and have always been directly or indirectly connected with the business, I hesitate to offer any advice, for every man's problems are different and what will work with one man under a given set of conditions will not work somewhere else.

Long Time Outlook Good

Let me say first, that I believe there is a fairly good future on a long time basis for good dairymen, and I know from the type of letter that you write and the way that you are thinking about your business, that you are a good farmer. Milk consumption is increasing with the steady growth of the cities and Eastern dairymen are comparatively near the market where they get the first chance in the sale of their product. Therefore, if you pay particular attention to the production of each of your cows, keep the poor ones weeded out and make a special effort to make every individual pay at least a small profit, I see no reason why you should not plan to continue to make dairying your chief and main source of income with every chance of making good during the next ten years, particularly after we get through another year or two of these bad dairying times.

Hens Work in Well

Speaking for the average dairy farm, the enterprise that goes best with dairying is poultry. If a man will give hens the same careful attention and care that he gives to his cows, they will pay year in and year out, even better than the cows do. This means careful culling, raising of new stock every year, good housing conditions and a constant study of the proper kinds of feeds. I do not know what your personal inclinations are, but I should say that from two hundred to five hundred hens or even more if you gradually enlarge your flock, would be your best guess to go with your dairy. You could also easily dispose of many or all of your eggs at good prices in connection with your milk business. The market is also looking for first class eggs.

Hogs on the Up Grade

It looks now as if hogs would be pretty good business for the next two or three years, but it takes special housing conditions and it is very difficult to raise them unless you have skim milk. If you do not have it, it is necessary to raise alfalfa or to give them special pasturing conditions, requiring special fencing and other items of cost which the average dairymen do not consider practical.

Sheep and Small Crops, Too

The same thing goes for sheep. Nothing has paid better during the last few years than sheep and the prospects are good for the future. But successful sheep require

some special ability and particular liking for the animal. There is also the very serious dog problem and sheep require as you know specially constructed fences.

If you can solve your labor problem, small fruits pay over a course of years especially well, and they would work in very well with your business. You could sell the berries for instance with your milk and soon have a special market. It is possible, also, to ship them out at good prices.

I do not think the Eastern farmer has made half enough of the small fruits and vegetables, particularly for use in his own family, but as you know, the raising of strawberries, raspberries or the smaller vegetables is also a special problem requiring some expert knowledge and a lot of labor. In working out this problem, however, may I suggest that you do not attempt too many things. After all, your fundamental business as I see it is dairying, and it is rather dangerous to try to add more than one or two other lines and to give the attention to all of them that would insure success.—E. R. EASTMAN.

Guernsey Class Leaders for 1924

The feature article in the February 15 issue of the *American Guernsey Breeders' Journal* contained the following statement of interest to breeders of this section:

The thirty-eight cows were bred by thirty-four men, as four breeders each bred two of the list. They were Babcock & Millard of New York; Arthur M. Smith of Michigan; F. L. Ames of Massachusetts, and B. A. Jacklin & Sons of Wisconsin. Twenty breeders made records on cows that they had bred themselves, while the cows tested by the remaining fourteen men were bought from other breeders. H. E. Babcock is well known to readers of *AMERICAN AGRICULTURIST*.

The highest number of class leaders made during the year rests with Babcock & Millard, Ithaca, New York, who made this honor on three different cows. Jay B. Deuteh, Big Bay, Michigan, and B. A. Jacklin & Sons, Waupaca, Wisconsin, each tested two cows that came among the ten highest in their classes. Thirty-four other breeders each tested one class leader cow.

One of the most pleasing points in the whole year's work is found in the comparatively large number of class leader records that were made by men who were having their first experience with Advanced Register testing. Babcock & Millard, for instance, made their three records on the first group of cows they tested. Others were Matt Domaszek, B. A. Jacklin & Sons, C. S. & H. F. Ristow, all of Wisconsin; H. A. Baxter, and Spillers & Worch of Ohio, and F. R. Hartzell of Pennsylvania. There may be others but these happen to come to mind just at the moment of writing. What better argument for the adaptability of the Guernsey to farm conditions could be desired?

Balancing A Ration

Please tell me what to mix with oats, barley and peas to make a good milk ration. It runs about 1 bushel oats, 1 bushel barley, 1/2 bushel peas. Also tell me how much grain to feed. I am feeding one large bushel ensilage morning and night and timothy and alsike at noon.—A. J. H.

On analysis we find that a representative sample of barley, oats and peas about like your own probably gives us 9.6% digestible protein and 72% total digestible nutrients. For a grain mixture I would suggest you use: 600 pounds, peas, oats and barley; 200 pounds gluten feed; 200 pounds linseed oil meal. Feed about one pound of grain to three of milk.

Paint Without Oil

Remarkable Discovery That Cuts
Down the Cost of Paint Seventy-
Five Per Cent.

A Free Trial Package is Mailed to
Everyone Who Writes

A. L. Rice, a prominent manufacturer of Adams, N. Y., discovered a process of making a new kind of paint without the use of oil. He named it Powderpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to A. L. Rice, Inc., Manufacturers, 134 North St., Adams, N. Y., and a trial package will be mailed to you, also color card and full information showing you how you can save a good many dollars. Write today.

Cull Your Eggs—

When You Set Them For Hatching

WHILE there
are many

By L. H. HISCOCK

have rough shells
or peculiar forma-

persons who prefer to buy their new poultry stock as young chicks, there are others who hatch their own eggs by natural or artificial means. When this is the case, some sort of culling is necessary. Not all birds are desirable breeders; not all eggs are hatchable. To cull breeders and to select hatching eggs is, therefore a profitable business, for, if you can weed out this egg or the hen that lays that egg, you increase your incubator capacity and have eggs to sell that would otherwise have been wasted.

L. H. HISCOCK

As far as culling your hens is concerned, observation is the quickest method of improving your flock. (I am assuming that the birds have been picked for their laying ability already,—this should have been done during the late summer or fall.) Perhaps some of these birds were kept over because they were good layers, but this does not make them good breeders.

Some Things for Observation

A small bird makes a poor breeder; her egg will be small; her chick will be small. Perhaps some of your breeding birds are in poor physical condition. The hen with good strength and vigor means a strong, healthy chick; a sick bird is a poor start for a successful ending in any breeding pen. Perhaps some of the birds have poor breeding behind them or are the freaks of some reversion. For instance a White Leghorn, every once in a while, has a red or brownish breast; it is a pure freak, but obviously, it would be a mistake to use this bird as a mother. Likewise, is this true of any bird with poor coloring or feathering. To breed such a bird spoils the quality of the flock. After all the perfectly normal, healthy, well colored bird is the best mother; she represents the pride of the flock and has good characteristics to pass on to her chicks.

Next to the hen comes the egg in importance. To take any old egg and put it under a hen or in an incubator represents a terrific waste. It would be a great discovery for poultrymen the world over if they could eliminate unhatchable and infertile eggs, but, unfortunately, there seems little chance of such a happy discovery. There are, however, a few simple principles that can do much to help any hatch.

Select Eggs Carefully

In selecting eggs the typical best grade for setting is not the small egg, not the large one, but rather the medium sized one of good shape. Extra large eggs do not hatch well and often times are infertile. Small eggs may be fertile and may hatch, but their very smallness makes them the forerunner of small chicks, or else precludes their hatching, because the chick is so large that it becomes cramped and dies in the shell. This same principle is true of the odd shaped egg. Take a long egg by way of illustration. If this egg is fertile, when it comes time for a chick to pick its way out, it will have little leeway to move its head or cramped body. Failure to break out of the shell ends a life, and, as in the case of the small or extra large egg, there has simply been a waste that might easily have been avoided. The medium, well shaped, oval egg is the best bet as a hatching proposition.

But there are still other things that can aid in the selection. Eggs which

tions on them are poor in hatching quality. A rough shell either denotes a porous egg, that is, one that has a weak covering, or else an unusually tough shell. In either case there is little chance of hatching a chick. In like manner, an egg shell that has nodules or humps on it prevents an even distribution of air. Aside from these particular classes of eggs it is a good thing to examine eggs carefully for checks or small cracks. A liberal supply of straw in the nests during the hatching season tends to eliminate this last difficulty.

Avoid Dirty Eggs

People often ask me if it is all right to set eggs that are dirty or soiled. It is unquestionably true that a very dirty egg sometimes hatches, but it is also true that the dirtier the egg, the poorer is its chance of turning into a chick. The shell of an egg is porous and the more dirt there is on it the less chance there is of air seeping through the shell. A muddy streak here and there may not do any harm, but, if the egg comes from a nest where an egg has been broken and is covered over with egg yolk and other filth, there is no chance of its hatching; no air can go through it to keep a chick alive. To wash any eggs that are to be set or even wipe them with a damp cloth is a fatal mistake, for, by destroying the blum of the outside surface, air penetrates too rapidly, making very rapid evaporation possible.

How Long to Hold Eggs

Another question comes to my mind: how long can I keep my eggs and still expect good hatching results? It goes without saying that the fresher eggs are set the better the hatch, but, where the breeding pen is small, this cannot always be possible. Ten days is a long time to keep eggs; two weeks is an outside limit beyond which a reasonable hatch is unlikely. The main thing with eggs that are to be carried a long time is to keep them in good condition. They should be rolled twice a day as if they were in an incubator; this prevents the yolk from becoming displaced or touching the shell of the egg. To keep eggs in good condition, aside from rolling and turning them, one other thing is necessary; they should be kept where the temperature is around 50°F. If the temperature is much lower than that they are very apt to spoil because of chill; if the temperature goes much above this point, evaporation is likely to be more rapid, and, if the temperature gets as high as 70°, germination may take place.

Selection Avoids Waste

Perhaps some waste in incubation is a necessity, or, at least until there is some way of determining fertility in eggs, there is no chance of setting one

(Continued on page 318)

Costs Only \$4.96, Complete

In an hour you can make a better brooder than you can buy. No tools needed but saw and hammer. It will do the work of 4 old hens and do it better. The materials, including heater, cost \$4.96.

I want you to try my Brooder and will send you plans for making it, together with a Putnam Brooder Heater, for \$4.75; all postpaid. Try the Brooder out and if you don't say it's the best Brooder you ever used, return the Heater in 30 days and get your money back. Your dealer will make you the same offer and guarantee. Ask him, but if he does not carry the Brooder Heater, send me \$4.75 and I will mail you a Brooder Heater and plans promptly.

Illustrated circular sent free on request.

The Royal, with the largest fire pot of any brooder on the market at our price, holds more fuel and burns either hard or soft coal successfully. The chicks are cozy, happy and growing under a Royal, when the fire would be out in a small stove brooder. The hover is extra heavy, wirebound and one piece. Five inch flue pipe, and combustion chamber four times as large as other standard stoves. Both check and direct draft are automatically controlled. The grate is large and extra heavy. Fire-pot has straight sides; soft coal will not clog.

Your dealer should have a full line of Royal Poultry supplies. We make brooders, leg bands, chick feeders and waterers, non-freeze fountains and the other supplies needed on the poultry farm. If your dealer can't supply you, send your order direct.

Reviewing the Latest Eastern Markets and Prices

MILK PRICES

THE Dairymen's League Cooperative Association announces the following prices that dealers will pay the League during the month of March for milk testing 3% in the basic zone of 201 to 210 miles from New York City. *It is to be understood, of course, that the prices mentioned below are not received by the farmer, but go into the pool. They represent the prices dealers pay to the League.*

Class 1 Fluid milk	\$3.07
Class 2A Fluid Cream	2.20
Class 2B Ice cream	2.25
Class 2C Soft cheese	2.15
Class 3A Evaporated whole milk	
Cond. whole milk	1.90
Class 3B Whole milk powder	1.85
Class 3C Hard cheese other than	
American	1.65

Class 4 prices will be based on butter and American cheese quotations on the New York market.

Sheffield Producers

The Sheffield Farms Producers announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$3.07
Class 2	2.20
Class 3	1.75

Class 4 prices determined by butter and cheese quotations on the New York market.

Non Pool Cooperative

The Non-Pooling Dairymen's Cooperative announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$2.80
Class 2	2.20
Class 3A	1.80
Class 3B	1.75

Interstate Producers

The Interstate Milk Producers Association (Philadelphia Price Plan), announce the receiving station prices or the price to the farmer in the 201 to 210-mile zone from Philadelphia for 3% milk is \$2.19. In the 101 to 110 mile-zone, the price is \$2.29.

BUTTER CONTINUES HIGHER

The steady climb upward continues in the butter market. The spirit of pessimism that was so evident in the trade only a few weeks ago has all disappeared, which is quite natural when we consider that fresh arrivals have not been any heavier than what the trade could clean up nicely. On top of that storage stocks have been

Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade which Brings Top Prices

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless, and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Tasteless. Large bottles cost only 35 cents at drug or grocery stores. Write for free sample bottle.

reduced at a phenomenal rate. Withdrawals have been almost unbelievably heavy. Demand is proving excellent. In fact all those things that go to make up an active market have been in operation and as a result prices have advanced so that now creameries scoring higher than extra, 93 score are selling for 49½ to 50c. This represents an increase of 8 cents since the first of March. 92 score butter is bringing 49c and other grades vary downward to 33½c for poorest qualities.

Whether or not the market will go higher is rather risky to predict. The sudden rise has brought in butter from distant cities as well as some foreign butter. Many receivers feel that a conservative policy would be a lot better to follow at the present time and rather talk against any additional price advances. Higher prices will undoubtedly curtail consumption with a consequent break in the market, which is always a disastrous affair. Since butter has reached its high point of 50c less speculative buying has been in evidence.

CHEESE PRICES ADVANCE

As we intimated in last week's report cheese prices have advanced so that now fancy to special held whole milk State flats are bringing from 26 to 26½c. Average run cured goods are worth from 25 to 25½c. The advance was not alone confined to cured goods but was also reflected on fresh marks which are bringing as high as 24½c for fancy make. Trading continues active and there is a fine tone on cheese of all descriptions.

EGG PRICES HOLDING

Fancy eggs have suffered no material change since last week due mainly to the fact that there are very few choice eggs arriving in New York City from nearby points. Undoubtedly hatching operations are responsible for lighter receipts of these choice marks. Be that as it may, there is a shortage of fancy eggs and such have been bringing as much as 40c, the same quotation as last week. There are more intermediate and undergrades than the trade can readily absorb and prices on these marks have weakened. In fact, the accumulations are reaching such proportions that we would not be surprised to see further price reductions during the coming week on these lines.

Choice closely selected nearby whites are bringing from 39 to 40c, while other grades downward are bringing varying prices to the point where 31c represents the prices of mediums. Nearby gathered whites are worth anywhere from 30 to 36c. Pullet eggs are bringing from 29 to 30c. Fancy marks of nearby henery browns are worth 36c, while lower grades cover a wide range.

POULTRY MARKET ACTIVE

Although the Jewish holiday, Purim, is over, nevertheless the live poultry market continues quite active. Receipts of late have been light with the result that the market has gradually turned to the seller's favor. Fowls are not as high as they were. Although the market was strong during the week ending March 7, nevertheless considerable stock was carried over Sunday with the result that just previous to the holiday there was some lowering in price. Advices report rather heavy supplies rolling from the south and southwest. These undoubtedly will have a weakening tendency especially if they all land at the same time. It is too far at this writing to make any predictions. Express fowls are working out freely at 32c, which is the freight market, although fancy lots are reported at 33c. Express chickens that are fancy and smooth legged have been bringing as much as 38c, although the average is in the neighborhood of 30c. Fancy broilers are weaker. A few sales are still reported at 60c but the majority of the business is being done at 5c below this figure. Capons are meeting an especially heavy market and are generally wanted. Ducks and geese have also been rather light in the arrivals and are working out fairly well.

POTATOES STILL WEAK

In spite of all that we can do to try to find some encouraging outlook for potato growers who are still holding stock, nevertheless the fact remains that the market is a dull, weak affair. Just what is in the future no one knows. It may be that there

suddenly will come a buying spurt such as occurred in the butter market during the past week, that will send prices higher. Few expected such an extensive and long sustained rise in the butter market in the face of storage stocks that are all out of proportion to our present needs. A boom such as this may come to the potato market. No one knows. But we have our doubts. There are too many potatoes in the country, not only in York state, but up in Maine, that there is little likelihood of us facing much of a shortage. It is really hard to get any definite quotations due to the fact that it is a buyer's market and buyers are offering a whole lot less than shippers are willing to accept.

We have been rather pessimistic about the potato outlook. For this we have been criticized quite severely. It is said we have been taking too much of the city viewpoint. Nothing has been farther from our minds. It is our earnest desire to so coincide market facts and country facts as to draw some interpretation of what may happen. We have known all along that the potato crop was a big one and in view of that we did not encourage holding the entire crop of potatoes to the end of the year for higher prices. There were, too many potatoes to play the market that way. We urged a policy of steady, well-regulated shipments to market to meet the demand and trade needs. Had the crop been held until now and then dumped, no one knows where the prices would have gone to.

CABBAGE CLOSING OUT WEAK

The old cabbage market is closing out weak. On March 12 it was impossible to get \$13 a ton in New York City. Even at this price a man will be out money if he shipped. The freight from most up-state points is in the neighborhood of \$6 per ton. This would allow him \$7 a ton at the farm to which he would have to add the cost of hauling and loading. In spite of the fact that State cabbage is still of very high quality, nevertheless the trade is turning to the new crop from the South.

BEAN MARKET EASIER

Trading is quite slow and dull in the bean market and as a whole the situation is becoming considerably easier. Some price weakening is indicated on most all varieties, especially pea beans. Even red kidneys are having a hard job to sustain their former values and have had to recede to a lower point. Very few pea beans are being sold above \$6.50. Red kidneys have receded 25 cents so that now they are worth anywhere from \$10 to \$10.50 per hundred for common to choice stuff. White kidneys range from \$8.50 to \$9. Marrows are bringing anywhere from \$9 to \$10.25.

HAY WEAK; OUTLOOK POOR

Excessive supplies of poor hay plus light demand have been responsible for a decided weakening in the market. On March 8 there were 49 cars of hay in the Melrose Yards and according to one of the best informed men in the trade the demand was for not more than 10.

If we quote 400 many market men we are apt to be criticized for taking their viewpoint of the situation. But here is something which the writer noted particularly the morning this report was written. We live out on Long Island and our train takes us to Pennsylvania Station. Walking from the Seventh Avenue entrance of the Pennsylvania Station, crosstown to Fourth Avenue, we made a particular note of the number of horses along 31st Street. There were six. This was at 8:15 in the morning and possibly a little earlier than regular trucking gets going. But the fact remains that horses are becoming scarcer on the streets of New York every year. There is still a big place to be filled by the faithful old horse in the downtown trucking district and along the river fronts, but those districts constitute only a small portion of the greater city. With a reduction of the number of horses the hay market is bound to become more limited which naturally affects the outlet for hay. Naturally the result is that only the best hay will find a ready market and a lot of low grade, discolored, coarse stuff is going to go begging.

We were talking to one of the oldest and best informed men in the hay trade the other day. He is Mr. Fred Williams. He gave us a letter to quote in part or

whole, setting forth his opinions of the future market. He writes as follows:

"We have received over 100 letters from farmers who have hay to dispose of which confirm our views as to the quantity of this product held by producers which they are anxious to dispose of. The 1924 crops was one of the largest ever produced. The fact that production was largely in excess of farm and market needs, prices will continue to rule low until another crop. We are unable to see any reason for farmers to realize higher values for these products by holding them. If you have hay of good to fair quality, have it baled and forward it to market gradually between now and the end of the planting season. If your hay is of poor quality, unsound, stained or damaged, taking into consideration the time cost of transportation and handling charges, we advise against forwarding to market, as it is of far more value for farm feeding. There is very little demand for other than good sound merchantable hay.

That tells about the whole story. There is no use spending good money for transporting a lot of poorly colored low grade hay to New York to have it lie around the sheds.

On March 11, fanciest No. 1 timothy was worth no more than \$25 a ton in large bales; No. 2, \$22 to \$23; No. 3, \$19 to \$20; sample, \$15 to \$18. Light clover mixed, No. 1, \$22 to \$25; No. 2, \$19 to \$21; No. 3, \$17 to \$18. Medium clover mixed No. 1, \$19 to \$21; No. 2, \$17 to \$18. Alfalfa second cutting, No. 1, \$29 to \$30; No. 2, \$25 to \$26; No. 3, \$23 to \$24. The market was weak, demand slow except on top grades of all kinds.

Local Buffalo Feed Market

No. 2 white oats, 59½c; No. 3 yellow corn \$1.31; ground oats \$40 a ton; spring wheat bran \$28; hard wheat bran \$29; standard middlings \$35.50; soft wheat middlings \$36; flour middlings \$43; red dog flour \$44; white hominy \$43.50; yellow hominy \$49; corn meal \$37.75; gluten feed \$47.75; 36% cotton seed meal \$40; 41% cotton seed meal \$42; 43% cotton seed meal \$44; 34% old process oil meal \$40.50.

New York Farm News

Demand For Farms a Little Better

THERE is a little improvement in the demand for farms although it may hardly be apparent yet. Occasionally one changes hands without being a forced sale. Prices are moderate and many farms are for sale for which there are no buyers. It is only in rare instances that a call comes from a buyer. More frequently the seller is urgent. The mere fact that farms have been sold where there was no actual necessity for the sale indicates that farms are not entirely neglected.

If one wants a farm it is perhaps a good time to buy for he can select as he could not for years before. One can buy at very reasonable figures if he takes time to look around. It is true that taxes are high and they will remain so. Just this year we are looking for a fairly prosperous year and it seems likely that farm produce prices and other prices are coming into better adjustment. If one is not too much in debt farming may not be so bad when this adjustment has been brought about. With gradually lowering prices as has followed others wars any debts will fail to come into adjustment except as they are paid off. This is something that one should consider.

In many cases in my vicinity farmers are attempting to earn some money away from home. Wages are good and where they can be had it is probable that they may be used now to pay up debts to very good advantage. A good many are doing this. Possibly some are getting the wages and living a little faster neglecting the debts. That is bad policy for the chance to earn such returns is not likely to remain always and then with the wage gone and lower prices common and the debts remaining one might find himself high and dry.

It looks as though the city man who bought a farm may be usually getting away from it. He was no asset to farming. He could outbid on wages for farm help and he produced considerable farm products that took the place of those that the real farmer wanted to sell. He had his other business or income and his departure from the farm is no disadvantage.—H. H. LYON.

New York County Notes

Cortland County—Farm activities are at a low ebb just now. Wood cutting is about all done. The roads are now all open to auto traffic although there are some drifts in shaded places. Cabbage prices are so low that no one is moving the crop. Dealers are buying potatoes for shipment at 35c per bushel. The new Sheffield milk station at Homer is now receiving 800 cans per day. Grade A milk will be shipped on April 1.—G. A. B.

Delaware County—On the last day of February the thermometer dropped below zero. March came in like a lion with a strong south wind and snow and rain. The earthquake was felt in this section but no damage was done as far as we know. During the bad snow we had in January, the conservation commission sent out requests for farmers to feed birds. We do it anyway and find it a source of much pleasure. Black birds were seen in February and

from Ulster County we received reports of robins, blue birds and black birds being seen. Indications point to an early spring. Many farmers have tapped their sap bushes. Eggs are 27c at the stores in town. The last we shipped to New York brought 48c. Hides are 10c; calf hides 25.—L. M. N.

Essex County—The winter as a whole has been quite favorable to farmers. Some have been troubled with water shortage. The cold weather came on without much previous rain and folks have been obliged to haul water for household purposes. There has not been much call for cattle. Dairy products are much lower than a year ago. Farmers are now busy cutting up wood and drawing up hay. Our coldest weather of the winter came in last January when the mercury was down as low as 50 below zero down in this section.—M. E. B.

Ontario County—About the last week in February practically all the snow is gone and the ground is bare in most cases. We had zero weather following a nice warm spell. Some farmers have tapped trees for syrup. Some farmers report water shortage.—H. D. S.

Tioga County—Several adventurous robins have been seen in different sections of the country.

R. M. Haze & Son held their Fifth Annual Agricultural Institute in Owego the last three days of the week ending March 7th. A corps of 20 demonstrators were on hand. Daniel Dean, of Tioga County expert potato grower, spoke on potato culture. Professor F. P. Weaver of the State College of Agriculture at Cornell spoke on Buying—the Other Half of Marketing. Dr. E. A. Bates of the Extension Department spoke on America and the Farm.

The Dairymen's League meeting was held at the room of the Farm Bureau of N. H. Easton of the Farm Bureau and was well attended. On March 6 the large barn of Frank Perry whose farm is located about midway between Catatonk and Candor was found to be on fire about 9 o'clock in the evening—too late to save anything. The heavy loss included 28 head of stock and 3 horses as well as a large amount of hay, feed, ensilage, machinery and a new automobile. Several outbuildings also burned, the house being saved with great difficulty. The cause of the fire was unknown.

Large quantities of potatoes remain in the cellars of farmers. The price has gone down again to 35c. Unless an advance comes, small potato growers will be in hard luck as they cannot raise their crop as cheaply as the large grower.

Eggs are retailing at 32 to 35c. Beef remains about the same but all pork products have advanced. Hogs weighing from 120 to 150 pounds have been sold to the markets at 15c per pound.

—Mrs. C. A. B.

Federal officers recently raided four places with search and seizure warrants in Owego, two in Waverly and found plenty of cause and they made arrests.

SKATER—My gosh! Harry, just stick your finger in this water and see how cold it is!—Judge.

FREE! Book on Treatment of Animal Diseases

DR. HUMPHREYS' VETERINARY MANUAL

This wonderful book of over 300 pages tells you how to take care of every living thing on the farm—It gives in great detail the symptoms by which you can properly diagnose each and every disorder that may cause the loss of stock, and tells how to relieve the trouble.

Sprains — wounds — lameness — spavin — splint, and hundreds of other troubles of horses are thoroughly explained with the proper remedies suggested by comprehensive stable chart.

Specific instructions for the relief of colic — cough — founder — heaves, cover a big part of this great book.

Over 300 pages devoted to the diseases of cattle, horses, hogs, sheep, poultry, dogs, etc.

This, the most complete work ever prepared to help the stockman save his animals from loss by disease is yours for the asking. Send the coupon today—the edition is limited—Act at once so as to be sure of getting your copy.

KILL RATS QUICK THIS NEW SURE WAY NOT A POISON

Why suffer hundreds of dollars' loss every year from the ravages of rats and mice when you can now so easily get rid of every one of these pests in less than a week?

Rat-Flu, the wonderful French discovery, recently increased to triple strength by our expert bacteriologist, is sure, quick death to rats, mice and all rodents, but absolutely harmless to pets, animals and human beings. It is not a poison. Charles Griffin writes: "Your Rat-Flu is marvelous. I used a bottle and after three days I found 19 rats outside, dead and dying." The Underwood Poultry Farm writes: "Recently we have seen many sick rats dragging themselves away and find many dead ones in the weeds. Your Rat-Flu is working in good shape."

Rats Die Outside

When just one rat eats this deadly Rat-Flu it becomes infected with a fatal, contagious Flu. Others become infected. They can't get well, but rush outside and die while seeking air and water. No odor, no dead rats to handle, no live rats to kill.

Special Introductory Offer

To further introduce our wonderful rat killer, we will send you our regular 6-ounce \$1.50 bottle of Rat-Flu for only \$1.00 prepaid, enough to clear your home, barn or poultry house of all rats and mice. Should you have several buildings infested with rats, it will pay you to send \$3.00 for our 18-oz. bottle. Use as directed for 30 days. Then if you are not satisfied, we will return your money. Our Guarantee backed by the West Central State Bank of Chicago.

If not convenient to send money today, just send your name and address and pay \$1.00 plus C. O. D. fee when delivered. You run no risk. Send today.

New Jersey Farm News

Legislation Notes—Pennsylvania News

THE New Jersey legislature which is considering a number of agricultural measures this year, promises to adjourn in late March, according to the schedule for adjournment recently announced. The organized farm interests in the state, represented by the Joint Legislative Committee of the State Farm Bureau and the State Grange have secured favorable action upon a number of farm measures, which promise shortly to be reported out of the legislature and up for the Governor's action. Prominent among these bills is a measure which would allow farmers to organize mutual insurance companies for the writing of their own risks. Another bill would increase the penalty up to \$100 upon the owner of a roving bull. A dairy bill which would make effective the bonding and licensing of milk dealers had been well advanced in the legislature by early March. The agricultural appropriation measures have not presented other than the usual difficulties.

* * *

In an effort to work out a practical arrangement between fruit growers and nursemeymen for improving business practices in the sale of nursery stock, the New Jersey Federation of County Boards of Agriculture, co-operating with the New Jersey State Horticultural Society, has called a meeting for Trenton, N. J., on March 24th. This meeting follows an effort on the part of fruit growers to secure a bill compelling nursemeymen to protect buyers against inferior practices in the sale of nursery stock. The bill is now inactive in committee, under mutual agreement, and the conference replaces the legislative effort to this end.

* * *

A recent survey of leading potato growers in New Jersey indicates considerable reduction in acreage to be planted in potatoes this year. Although too early in the season for definite estimates, it appears that the reduction may be as great as 15% to 20% from last year's plantings. Information gathered from County agents and other co-operators in Maryland, Virginia, the Carolinas and further south indicates similar considerable reduction in acreage planted and to be planted in early potatoes. New Jersey growers, however, expect some of this reported shortage to be made up as the season advances and, to quite an extent, to discount the reports received.

* * *

Favorable weather in mid- and late February brought farmers in the central and southern part of the state outside for Spring activities. Corn stubble and other land was being plowed to quite an extent in preparation for early Spring work when the ground warms up. Reports from the northern part of the state indicate pasture land in good condition and although some winter damage took place on Winter wheat, rye, and more exposed pasture lands, the general situation on cover crops and meadows is satisfactory for the season.

Lime Train in Pennsylvania

Farmers in western Pennsylvania will have an opportunity to visit the educational exhibits to be shown in a special educational lime train operated by the New York Central railroad in the western part of the State from March 16 to 31. Various State agricultural institutions and several lime manufacturers are co-operating with the railroad to make this service complete and of actual value to farmers contemplating the use of lime this Spring.

The train is practically identical with the one operated in various sections of New York State. Farmers are invited to bring samples of their soil to the train for testing and a separate report and recommendations will be given free of charge in each case. Lectures by prominent lime and agricultural authorities will

be given en route. Motion pictures telling the story of soil fertility will be shown.

Demonstrators are being chosen along the line of the tour in order to make permanent the recommendations of the co-operating agricultural authorities on soil fertility problems. The details of the tour and the schedule of stops may be obtained by addressing the Agricultural Department of the New York Central railroad at Columbus, Ohio.

Death of A. B. Farquhar

IN the death of A. B. Farquhar of York on March 5th, Pennsylvania lost one of its foremost citizens. Mr. Farquhar was widely known as a student and author on political finance and the tariff; he was the writer of many articles on economic and business conditions, and he had always a deep and sympathetic interest in agriculture. His early interest in mechanics finally led to his taking up the manufacturing of agricultural implements and machinery, and his company, the A. B. Farquhar Company, is widely known and respected for its high class products.

Mr. Farquhar had an interesting acquaintance with a large number of great men of his time, including American and British statesmen, extending over a long period of years, and all of the presidents of the United States from Lincoln to Har-

ding. It is said that the courage and foresight of Mr. Farquhar saved his city of York from being destroyed by the invading Confederates in 1863.

This business Mr. Farquhar founded will continue.

Central Pennsylvania Notes

J. N. GLOVER

RECENT tests of seed corn by the county agent and by farmers who had many ears selected for seed shows poor germination, yet some good testing corn has been found in corn cribbed early.

The drop in the price of wheat has stopped the sale or marketing of it, since some wheat is being held for \$2.25 a bushel. Very little corn has been marketed at the market price of \$1.25 for it is expected that corn will sell for \$1.50 before long. Farmers meetings are being held in different townships by the county agent to plan experiments and to try out new varieties of corn.

Public sales have begun and will continue through March. Cows sell well considering the price of feed and of milk. Several farms have not been rented for this spring.

With the recent mild weather some apple trees have been trimmed but no other farm work can be done except work up fire wood for the summer. We had the first thunder of the year on 23rd of February.

CLASSIFIED ADS

SEEDS—NURSERY STOCK

OUR SHORT STEM DANISH cabbage yielded twenty-two tons per acre last season. Send us your order for plants, dollar fifty per thousand, seed four dollars per pound, postpaid in third zone. PIERPONT and SMITH, Cassadaga, N. Y.

WOOLENS. Material for ladies' wear direct from factory. Write for samples, and mention garment planned. F. A. PACKARD, Box A, Camden, Me.

HIGHEST QUALITY MAPLE SYRUP and sugar. Circular free. HILLSDALE FARM, Glover, Vt.

THAT there is a difference between the average potatoes used for seed and the certified seed is no longer a doubt in the mind of Rev. Lester Hostetler, a young Mennonite minister of Holmes County, Ohio. In the spring of 1922, Rev. Hostetler began cooperating with the Holmes County Farm Bureau in the improvement of his potatoes, and started a certified seed potato project. He sent to Michigan for ten bushels Rural Russet or as some name them, Rural Potoskey seed potatoes. This seed was planted alongside of the other ordinary seed which he had, and which consisted of several varieties.

In the fall of 1922, at the demonstration held at Rev. Hostetler's home under the direction of county agent T. A. Wheeler, it was found that the Rural Russets yielded 192 bushels per acre, while the other ordinary varieties yielded 100 bushels per acre. Rev. Hostetler had also planted a few rows with hill-selected seed of the Rural New York variety, and they yielded 175 bushels per acre.

Pays to Hill-Select or Use Certified

Following this experience Rev. Hostetler came to the conclusion that it pays to use certified seed potatoes, the certified seed being the better, of course.

At the 1922 demonstration his crop was so nearly all engaged for seed purposes that he was again obliged to purchase seed, getting it through the farm bureau pool. Twenty-two bushels were planted on two acres. He intended to use thirty bushels, but in cutting the seed the pieces were made too small, so that only 22 bushels were used to plant the field.

This planting yielded 150 bushels per acre, and was on a northern sloping field, and one which every farmer in the community regarded as a run-down piece of soil. The yield was a surprise to everybody. The tubers were smooth and of good quality. They were planted June 5th. One acre was sod which had a coat of manure. The other acre was corn stubbles and had no manure. Four hundred pounds acid phosphate were applied, two hundred with potato planter and two hundred with grain drill. Rev. Hostetler says, he likes to plant late on account of weeds, and bugs. It makes less work.

Does Not Omit Spraying

He is an ardent advocate of spraying. He sprayed his potatoes three times last season with Bordeaux mixture which was a home-made preparation. A potato sprayer is a part of his equipment which is really an attachment belonging to his fruit spraying outfit, and can spray two acres in one hour, four rows at a time.

Rev. Hostetler was one of the first in the county to grow Rural Russet potatoes, but his willingness to give them a trial resulted in success for himself, as well as giving the entire county something new in the raising of potatoes. Every part of the county has a number of Rural Russet potato growers now. —W. E. FARVER.

A Man Who "Sells" His Potatoes

I WAS greatly interested to hear the views on marketing of a successful potato grower in a section which is hardly a specialized potato growing region.

This farmer lives about ten miles from a city of fifteen thousand people and has practically cornered the trade for potatoes among the hotels and restaurants of the city. "I take a truck load and unload at one place" he said, "While others are attempting to peddle ten bushels from house to house". A neighbor of mine took ten bushels today along with some other things, and brought back four. I took forty-five bushels and unloaded them all at one place".

"Everyone can't do that, though" I said "Because there wouldn't be enough demand. You have nearly cornered the hotel and restaurant trade".

Riverside Oversize Cord Tires and Tubes

Read what the users say

Does a Riverside Cord last as long as any tire? Is it as good a tire as any tire made? Is it as well made as a tire can be made? Tens of thousands of users of Riverside tires answer enthusiastically—"Yes!"

Just forget that our prices are low. Compare quality, service, mileage—tire for tire, and Riverside Cords stand equal to the best. There is a big saving in price—and the quality, mileage, service is all that you get in any tire.

How our low prices are made

Riverside tires cost as much as other tires to make. You pay as much for fabric, rubber and labor. But you pay less profit. That is why Riverside prices are so much less. We are the largest retailers of tires in the world. We sell 5,000 to 6,000 tires per day. Riverside Tires are made in the best factories—on our specifications, under our supervision. We know their quality.

Greater Protection against Skidding

Big heavy blocks of live rubber and extra thick side studs and the husky ribs of Riverside Cords grab the slippery roads and are your greatest protection against skidding.

Riverside Cords are thus the safest tire, the most satisfactory tire and the most economical tire you can possibly buy. Why pay more?

For 53-years Ward's have sold "Quality" goods only—with a definite "Money Back" guarantee.

The reliability of Montgomery Ward & Co. is beyond question. You can not buy a tire with a better guarantee.

"A pair of Riverside Cords have already given me one year's service on rough mountain roads, and they have never been off my car. You can't beat Riverside for good road service."
 James A. Kipe,
 Cascade, Maryland

"The Riverside Cords I bought last Summer show very little wear. High-priced tires put on my car at the same time are all gone. I tell my friends to use Riversides and get their money's worth."
 Chas. F. Poor,
 Danvers, Mass.

"A Riverside Cord on my Buick, with your heavy duty tube, has run 15 months, in use every day, and it still has in it the same air put in 15 months ago. 'That's going some!'"
 D. S. Robbins,
 Las Cruces, N. Mex.

Montgomery Ward & Co.

"But they all had the same chance as I to get it. I had to go out and get the trade. It took a lot of work and time to work up the demand."

"How did you work up your trade?" I asked.

Delivers Quality Goods

"For one thing I deliver quality goods" he replied, "I began by taking a half bushel to each hotel and asked them to try them at my expense. Then I offered to sell, and guaranteed my goods. I told them if they found potatoes that were not up to standard to keep them and I would buy them back at full price. Lots of men can grow good stuff, but not everyone can sell it. As to finding a market now, I have often thought that if I did not have this market which is all I can manage, I would go to Buffalo with some samples, visit the big hotels there, and try to sell them potatoes for baking".

"Perhaps your plan wouldn't work as well with other products as it does with potatoes", I said.

"Possibly not, but I believe that a man who puts some time and thought on the business of selling his crops can find a way of getting more money than the man who takes things as they come".
 —H. L. Cosline, New York.

Leather Variation Causes Clutch Trouble

A NEW leather had been installed on a cone clutch. Afterward the clutch grabbed badly in spite of several applications of neatsfoot oil. Investigation then revealed that though the cone was truly circular the leather was not because it varied in thickness. To determine this, the clutch was rotated in the car while holding the edge of a screwdriver near the circumference of the cone. The amount of eccentricity or unevenness can then be readily seen, and if it exceeds one-thirty-second of an inch it is likely to cause trouble.—"Ed. Henry."

Now Only \$5.69 Puts A Witte On Your Place

Thousands Accept Liberal Offer On This Famous Throttling Governor Engine.

Thousands of farmers, appreciating the need for cheap dependable power on the place, have accepted the liberal offer of Ed. H. Witte, world-famous engine manufacturer. Mr. Witte makes the startling offer to put the standard Witte Throttling-Governor Engine to work for you for as low as \$5.69 down.

The famous Witte Throttling-Governor Engine, known all over the world, comes fully equipped on this offer. Has celebrated water-proof WICO Magneto and forty other improvements, including a new device that makes starting easy at 40 degrees below zero.

The Rugged, Dependable Witte

Long regarded as the cheapest and most dependable farm engine built, the WITTE develops 50% extra power on either kerosene, gasoline, distillate or gas. Operation on full load figures under 2c an hour. Trouble-proof and so simple that the women folks can operate it. Easily moved from job to job. More than 150,000 WITTES are in daily use.

To introduce this remarkable engine to a million new users, Mr. Witte will send it anywhere, direct from factory, for a guaranteed 90-day test.

Every reader of this paper who is interested in doing all jobs by engine power should write today for a free copy of a remarkable new, illustrated book just issued by Mr. Witte, which explains the engine fully. You are under no obligations by writing. Just send your name, a postcard will do, to the Witte Engine Works, 1803 Witte Bldg., Kansas City, Mo., or 1803 Empire Bldg., Pittsburgh, Pa., and receive this interesting and valuable book that gives you valuable information about the application of engine power on your farm.

Cull Your Eggs

(Continued from page 313)

hundred per cent eggs. Until that day arrives, the careful selection of stock, the use of choice, well graded eggs, and the employment of a small amount of time in caring for them during the interval before the hatch,—these simple things will do much to prevent waste.

Points I Have Watched Since Boyhood About Setting Hens

I FIND that when you find you have a hen that wants to sit, let her stay on the original nest in the laying house two or three days, and if she acts right and "attends to business," then carefully transfer her to the setting room after dark, carrying her carefully in the arms, no dangling by the feet, and place her gently on the nest that you have made ready, with one or two china or dummy eggs under her. Be very sure to thoroughly dust her with Dalmation insect powder, or some other good lice powder.

If possible, you had better wait until you have a second candidate before placing the eggs under the first one, for it is much better to set them in groups, otherwise every day will be "hatching day, by and by," and besides, when two or more are started at the same time the eggs can be tested and perhaps all the fertile ones can be put under one,—or if three are set, all under two hens.

I keep this up until hatching time, and then if hatches are not good, further economy of the hen's time may be brought about by giving all the chickens to one or two and setting one of the hens over again in another group. This does no harm and she really seems to sit better the second period than the first.

Keep Hens Dusted

About once a week I dust each hen carefully with a good lice powder doing this after dark. By keeping the hens off the nest for one half hour per day the birds do not foul the nests. If any eggs get broken, carefully wash them in lukewarm water, make a new nest if the original one is soiled, and let the hen go back to work at the usual time.

When hatching time comes and the eggs begin to chip, don't take the hens off the nest until the hatch is over; let them entirely alone, simply taking the other birds off without disturbing the new mothers. At no time should the sitters be disturbed needlessly, but the day that the hatch is "coming off" is the time that particular attention should be paid and "NO ADMITTANCE" should be posted on every nest box.

You have doubtlessly noted how carefully a good sitter will hug the nest during this interval. There is a reason. During the act of exclusion while the chicks are breaking through the shell, there is quite a bit of moisture released under the hen. If this moisture is allowed to escape, the half-hatched chicks sometimes stick in their shells, as they do frequently in the incubator but if the hen is not disturbed she holds this moisture under her and the hatch is usually perfect: viz., every chick that chips usually comes out.

Doubling Up Hatches

The morning of the twenty-second day, remove the egg shells and the unhatched eggs, and if the hatches are good, let each hen "mother" have

RELIABLE BABY CHICKS

Produced under Supervision of Men Trained by Poultry Department, Ohio State University

R. E. FADER

When the Poultry Department of Ohio State University agreed to train and authorize men as inspectors for the Accrediting of hatcheries which come up to their standard, Mr. R. E. Fader of Norwalk Chick Hatchery immediately put his flock under such supervision. He is hatching and selling nothing but Accredited chicks. Mr. Fader has been in the poultry business 22 years and has an unusual record for success in his line of work. His flocks are carefully bred and the chicks he produces are healthy and strong.

He is offering chicks from eight breeds at a fair price. The public can buy chicks from the Norwalk Chick Hatchery and feel sure that they will get honest and square treatment. Mr. Fader will send a fine illustrated catalog on request, if he is addressed at the

twelve to fifteen chickens of her own hatching. If hatches are not good, double them up after dark, putting not more than fifteen or sixteen chickens with a hen, and set over again the hen that is thus relieved, letting the chickens stay another day under the new mother. She will then own them all, whereas if you attempt to add to her flock after she has left the nest, she is not always so motherly and sometimes picks and kills the new members.

P. R. P., New York.

Be Ready For the Baby Chicks

Whether you buy baby chicks or hatch them in an incubator everything should be ready for them beforehand. The brooder houses cleaned and clean litter put on the floor. It is a good idea to run them for a while to be sure everything is in running order.

Have chick grain on hand and sour milk ready. Brooder houses should be warm before putting chicks into them. Avoid getting chicks chilled. We think that they should have a drink of sour milk before anything else is given them. Hard boiled eggs mashed fine and rolled oats are fed at first and then chick grain. It is better to feed a little at a time and often than too much at one time. Four or five times a day is not too often.

—Mrs. E. M. N., New York.

Chicks Stick in Shell

For the last two years our peeps or chicks stuck in the shells when they were coming out and we lost so many in that way. We use incubators.—H. W., Pennsylvania.

Undoubtedly the moisture control in your incubator is not operating to its greatest efficiency for it is quite evident that the lack of moisture is responsible for the dry condition of the outside of the shell. We would suggest that you make a thorough investigation and find out where the deficiency lies. Read the instruction book that accompanied the incubator. Undoubtedly you will find that you have overlooked some detail in the manipulation of the moisture control.

The Earthquake in the Hen House

Seeing several letters lately on the behavior of the hens during the eclipse I thought folks might be interested in the effect of the recent earthquake produced on the hens.

I may say that the shock was so slight here that those of the family who were downstairs never noticed it but two

GRANGERS TRIPLE PURPOSE GRIT

WILL MAKE YOUR HENS LAY MORE EGGS

W It is sharp and clean, and absolutely the best substance that can be procured for grinding the chicken's food in the gizzard, and thus aiding digestion, and it is so white that there is no waste, as the chicken finds and gets it all.

N O NEED FOR OYSTER SHELLS

H GRANGERS TRIPLE PURPOSE GRIT is superior as a shell-maker. It produces uniformly hard shells that will not break easily, and does away with any need of oyster-shell, magnesium, or any other such materials fed for shell-making.

B ALANCES THE RATION—INSURES DIGESTION

GRANGERS TRIPLE PURPOSE GRIT has a definite mineral content of Sulphur, Carbohydrates, etc., which gives the proper balance to the food required by both chicks and adult birds to keep them in good health, and enable the chickens to produce the best eggs and more of them.

LINESVILLE HATCHERY, Box T, Linesville, Penn.

who were in bed felt the bed tremble for the space of about 20 seconds. Our house is founded upon a rock so that may be the reason we did not feel it badly.

The family took the news so calmly I was rather ashamed of my own inward quaking but on opening the door in the morning the first thing that caught my eye was a poor unfortunate hen who was hanging by one leg from the netting wire we had over the glass window in one of the pens. She was quite dead. The two large panes were completely smashed out and on entering I found that the hens had spent the greater part of the night on the floor.

The other two pens I have, had not been disturbed. They are not crowded like the alarmed pen is just now for I have them thinned out as I intend to start hatching in a day or two.

I said at breakfast that it must have been the earthquake but my husband laughed deviously—he had not felt the shock and said it was the moon shining in or a rat jumping down among them. I did think it very extraordinary that the hens should have noticed it, so I did not press the point, but later in the day we heard from our nearest neighbor that her hens had made such a fluttering and noise it wakened them out of their first sleep and thinking there must be chicken thieves at work they rushed out with club and lantern for battle. They found the hens scattered all over the house seemingly crazed with terror and they stayed with them quite a while till they flew back to their perches again. I think it was the previous night we had a very high gale of wind. The trees were creaking and there was great noise going on the whole night through, but the hens sat securely on their perches. How then did the very slight trembling of the earthquake disturb them so much? Can anyone explain?—Mrs. T. Thomson.

Keeping the Incubator in the Cellar

THE cellar or basement I have never considered a good place for an incubator, though many keep them there. Early in the spring the cellar or cave is cold and it takes too much heat to keep the incubator temperature up, and lamps are inclined to overheat and smoke. A neighbor had a hot air machine that smoked until the eggs were black with soot and the machine had the air pipes so they did not let the fumes from the lamp get inside until the soot filled the draft. Another woman had her incubator catch fire and almost burned the house down besides ruining the eggs. Then the air in cellars and caves is apt to be impure from lack of good ventilation. Basements are not quite so bad but are not ideal in most

"Oh, Brother Mule, but this world is full of woes!"

"It's not the woes that I mind—it's the giddaps!"—Judge.

1887 BABY CHIX 1925

From Hogan tested high flock average parent stock guaranteed in every way.

Anything Less Than the Best is a Poor Investment.

Slow growth and low egg production will soon wipe out ten times the small amount it is possible to save on the purchase price of day-old chix.

Quality breeding is of VAST IMPORTANCE to you. We have that quality and guarantee it.

White Leghorns in 25 lots or 1,000 lots; Brown, or Buff Leghorns, Anconas, Black Minorcas, R. I. Reds and White Rox in 25 lots or 500 lots at very reasonable prices. WRITE TODAY.

The Trouble Maker—By E. R. Eastman

"MEAD," he said ominously, "if you don't answer those questions the way you should, I'll commit you for contempt of court!"

"Now," said Hamilton, "answer my question."

"The horses couldn't get away because the men grabbed them," said Bill.

"Then what happened?"

"One of them climbed up on the wheel and grabbed hold of me. I hit him on the nose and he fell back in the dust."

"Yes, go on."

"Three or four jumped up at the same time, and I hit one of them, but the other two grabbed me and pulled me off'n the wagon."

"All right. Go on till I tell you to stop."

"I fought back and forth for an hour or so."

"Hold on, hold on! How long did you say?" asked the lawyer.

"Well, I fought them up an down the road," said Bill, "for—quite a spell, knocked down twelve of fifteen of them, but finally there were so many of them they got me winded, knocked me down and jumped on me."

"All right. What next?" asked Hamilton.

"They turned the wagon around so short I thought it was going to tip over, and they dragged me up out of the road and put me on the wagon and told me to take the milk back to Johnny Ball's and if I came again they'd kill me."

"You say," said the lawyer, "that all of the men had black cloths on their faces?"

"Yes," said Bill, "I—"

"Never mind the comments. Answer my question. Did you know any of these men?"

The people in the courtroom almost stopped breathing as they leaned forward to get Mead's answer.

"Yes," said the witness.

"Do you know this defendant, James R. Taylor?"

"Yes, sir. Known him all my life."

"Was he one of the men?"

The witness looked at the floor, then he looked at Taylor and then back to the lawyer, nodded and said:

"Yes. He was the leader of the gang."

The lawyer turned and looked at the jury, pausing a moment for them to get the significance of this answer.

Then he said to Mead, "That's all, my man. You may be excused."

Bill got up from his chair, and started back toward the audience.

"Just a minute, Mr. Mead," came a calm, pleasant voice, "if you don't mind, I would like to ask you a few questions."

It was Winslow speaking. Bill hesitated, looked at the other lawyer, then turned and sank back into the witness chair.

Speaking as if to an old friend, Winslow said to him:

"I don't keep you but a few minutes. I heard your story with a good deal of interest, but there were one or two points that I did not get quite clear. What time was it when you got up to do chores on Tuesday, October 3rd?"

"Half past three!"

"Would you mind telling the jury also about how many men there were in that gang that you said set upon you?"

"At least sixty," answered Bill promptly.

"Good," said the lawyer, turning to smile at the jury.

"Now let me see. You were telling about how these so-called highwaymen shot at you. How many of them had guns and revolvers?"

"All of them," said Bill. "Some of

them had a revolver in each hand."

"Your honor, I object," shouted Hamilton, jumping to his feet.

"On what grounds?" asked the judge.

"The witness did not testify as to guns in his original statement, and therefore, it is irrelevant and should not be brought into the cross-examination."

"Your honor will recall," stated Winslow courteously, "that the district attorney did try to prevent a statement about guns by the witness, but nevertheless such a statement was made to the jury. Therefore, my question is relevant."

The judge called the district attorney to him, and they whispered for a moment, after which, the judge said:

"The objection is over-ruled. Proceed with your examination."

"Mr. Mead, you stated," said Winslow, "that some of the bullets hit the milk cans."

"Yes," said the witness, interrupting, "I remember because one of them went

defendant, James R. Taylor?"

"Yes," said Bill.

"How long have you known him?"

"About fifteen years."

The lawyer paused for a moment to look at the jury again.

"You stated in your direct testimony a little while ago that this defendant, James R. Taylor, was the leader of the gang that attacked you on October 3rd?"

"Yes, sir, he was," said Bill nodding his head.

"Will you kindly tell the jury how you were so certain? Did you recognize the clothes he had on?"

"No," said Bill. "He wore different ones."

"How about his voice? Was it the same voice?"

"No, can't say that it was. He changed his voice."

"Well, how did you know it was Taylor?"

"Uh—ch—I—dunno," said Bill uncertainly. "I just knowed him, that was

and dumped your milk?"

"Yes," said John Ball. "I am sorry to say that he was the leader."

There could be no question that this answer scored with the jury. The old man was sincere, and believed what he said.

In the direct examination, the district attorney asked Ball to describe the events on the night when his milk was dumped and kerosene put into his milk house.

Winslow was instantly on his feet, to make vigorous objection.

"This defendant is on trial for just one thing, and one thing only! that is, for the alleged attack on Mr. Ball's milk on Tuesday, October 3rd. He is not charged with any other crime. Therefore, any testimony as to what happened in Ball's milk house at some other time is absolutely irrelevant."

"Your honor," purred the district attorney, "nothing is irrelevant that shows the depraved character of this defendant."

"Objection is over-ruled," growled the judge. "Proceed with your examination."

Winslow paused to let the full effect of the judge's ruling register on the crowd. At no time during the trial was the feeling in the courtroom as tense as it was over this unfair ruling. Winslow sat down, and Hamilton resumed the examination. He brought out the fact that on the night his milk had been dumped in his milk house and kerosene split, he had caught Taylor, the defendant, loitering near his milk house, that he had taken a look at the ruin on the inside and then had forced the defendant to come into the house, and had plead with him to say that he was sorry and would mend his ways.

"And what was Taylor's answer to that?" asked Hamilton.

"He defied me and walked out of the house."

"All of this," said the attorney, "was after he had committed the first outrage and dumped your milk in the road near the Harris barn?"

"It was," stated John Ball, his white beard bobbing up and down as he nodded in the affirmative. "He dumped my milk in the road a week ago Tuesday, and the milk in the milk house on Friday, a week ago today."

Winslow did not detain Ball very long on the cross examination. He first showed that the old man was excited when the attack occurred in the road, and that the men were masked, making recognition difficult.

"Did you notice, Mr. Ball, whether the gang that attacked you in the road had guns?"

"No," said John Ball, "the only gun I saw was the one I had."

"Has it occurred to you that this defendant might have been at your place when your milk was dumped in the milk house to prevent trouble, and not to make it?"

"Caught him dead to rights," said Ball.

"No, I beg your pardon," stated the lawyer courteously, "not according to the testimony. You didn't catch him actually dumping your milk, did you?"

"N—no," said the old man.

"One more question, if you don't mind. This defendant has carried his arm in a sling from an injury that he received on the night that your milk was dumped. Did you cause that injury?"

"No," answered Ball, raising his beard indignantly. "Of course not!"

"Did you notice that he was hurt when you were talking to him?"

"Yes," said the witness, "some blood ran down his arm on to the kitchen floor. We were goin' to fix him up, but

(Continued on opposite page)

What Happened in the Story Last Week

THE day of Jim Taylor's trial has arrived. The milk strike between the dairymen and the dealers has reached the high point. Jim, the acknowledged leader of the dairymen, has been charged with being a "trouble-maker". He is charged with having lead a group of men who forcibly attempted to prevent Jim's neighbor John Ball, from delivering his milk. Ball brought about Jim's arrest and the charge against him. The day of the trial finds an enormous crowd of country folks from miles around gathered at the county court house. No trial in years had attracted so much attention. Without the usual preliminaries the jury is selected and the District Attorney opens the case, stating that he is going to prove that Jim Taylor headed the gang of disguised dairymen who interfered with the delivery of milk belonging to John Ball. Bill Mead, John Ball's hired man, is the first witness. His testimony is typical. He exaggerates facts and contradicts himself many times. At times he has the court in an uproar. It is with difficulty that the District Attorney keeps him on the right track and finally appeals to the presiding judge to reprimand the witness and direct him to answer questions properly.

right through the side of one of the full cans and as I was stooping down behind the can the milk spurted out of the hole and hit me in the eye."

"The men you say, were coming down from the upper side of the road toward the wagon when they were shooting?"

"Yes," said Bill.

"And you were protecting yourself behind the cans on the lower side?"

"Yes, sir, that's right."

"And the milk came out of the bullet hole on the lower side of the can and hit you in the eye?"

"Yes, sir," said Bill. "I remember it because—"

"Just a moment, Mr. Mead," the lawyer interrupted.

Then turning to the jury, "Gentlemen of the jury, will you kindly fix very firmly in your mind this witness's statements on the bullet hole in the lower side of the can, and remember that he has stated that the men were shooting from the upper side."

An audible snicker passed over the audience, but died out quickly as they leaned forward to listen.

"Now you were saying?" continued the lawyer, turning again to the witness.

"I was saying that I remember it well," stated Bill, "because the darned milk in my eye made it so that I couldn't hardly see for a day or two."

At this point, Hamilton again raised strenuous objection, and made an impassioned plea to the judge that the witness was wasting the court's time and should be excused. Judge Rising would have agreed, but he did not quite dare to be too unfair. He contented himself with reprimanding Winslow for taking too much time and warning him to stick to the subject. Winslow made no reply but continued with his examination.

"Are you well acquainted with this

all."

The lawyer turned suddenly and shot a question short and crisp.

"Did all the men wear masks?"

"Er—er—yes," said Bill.

"It was difficult for you to see because of the milk in your eyes, and still you are sure you recognized Taylor?"

Before Bill could answer, Hamilton had objected and the judge sustained him. But the damage was done. The audience was all grinning, and even some of the jurymen were having difficulty in hiding their smiles.

"That will be all, Mr. Mead," concluded Winslow. "Thank you," and Bill left the chair without being stopped by the district attorney for re-direct examination.

"For once, I'm not s'prized!" said Ann Jenkins.

The judge banged his gavel and recessed the court until the afternoon session.

CHAPTER XXVI

JOHN BALL was the first witness called by the prosecution at the beginning of the afternoon session of Jim's trial.

He was a good witness. A little hesitancy made him seem reluctant to give his testimony, but his answers were direct and to the point.

"About what time was it when this gang dumped your milk?" asked Hamilton.

"I don't know the exact hour, but it was after ten o'clock in the morning, because it was the second time I was trying to deliver the milk."

After he had testified to the dumping of his milk by the masked gang, Hamilton asked Ball if he knew the prisoner at the bar, and John answered that he certainly did know him, had known him ever since Jim was a boy.

Then came the question, "Was this defendant in the gang that attacked you

but he said it didn't amount to nothin' and walked out."

"Another thing. Has it occurred to you, Mr. Ball, that it would be difficult for a man badly injured in one arm to raise the rumpus in your milk house that you say was raised on the night of Friday, October 6th?"

"No, mebbe not," said the old man. "All I know is the milk and kerosene were dumped in my milk house, and I caught this feller on the job without no excuse or reason for bein' there."

"That will do, thank you."

The third witness for the prosecution was Miss Caroline Hicks. Caroline was sworn and took her seat with sal-low cheeks aflame.

"Will you state your full name, please," asked the district attorney. Caroline would, and did.

"And your age, please."

Caroline was indignant.

"What difference does that make?" she snapped. "I'm old enough to have some common sense."

The judge was getting peevish and leaned forward and spoke to the witness. "Please state your age without further comment," he growled.

"My goodness! Listen to that now," "Well, if you must know, I'm thirty-one," said Caroline without hesitation. said Ann Jenkins in an undertone. "That woman is worse than Bill Mead! I happen to know that the fly leaf of her old family Bible says different."

The people in the audience around Ann were grinning.

The district attorney proceeded.

"Do you know this defendant, James R. Taylor?"

"Yes," said Caroline.

"Miss Hicks, will you tell the jury where you live?"

"I live on the north side of this town, about a quarter of a mile."

"Were you at home on the evening of Friday, October 6th?"

"Well, I wasn't home in the early part of the evening," stated Caroline. "I was over to Nancy Wiggs', and we were talking about—"

"Never mind," interrupted Hamilton. "That is not important. Were you at home between ten and eleven P.M.?"

"I was," said Caroline.

"Did anything unusual happen?"

"There did," Caroline's eyes snapped. "Please tell the court."

"Well, I had wound the clock and picked up Tommy and went to the door to put him out for the night, and it was sich a nice, warm moonlight even-ing that I just thought I'd go down to the gate a minute and as I was standin' and thinkin' of what Nancy had just said about—"

"Never mind what you were think-ing. Tell what you saw."

"Didn't see anything at first," said Caroline, "just heard somethin'."

"Yes, yes, tell the jury what it was."

"It was a horse runnin', and in a min-ute I saw a horse comin' down the road right by my gate, and he was just run-nin', and the man on his back—"

Caroline paused, dramatically, while the crowd held its breath.

"Tell the court who the man was."

"Well, just as he got opposite my gate, he turned his face toward me and he wasn't more than six feet from me, and he didn't see me but I saw him—"

"Yes, yes, who was it?" shouted the exasperated attorney.

Caroline turned in her chair and pointed a long finger at Jim.

"It was that man there, Jim Taylor."

"Had you seen Taylor before that day?"

"Yes," said Caroline, "just before I went over to see Nancy Wiggs, Jim Taylor drove down by my place to town with his horse and wagon."

"What makes you think he was not going home?"

"'Cause he didn't have his wagon and he was up to something bad, 'cause he was running his horse."

"All right, that will do, Miss Hicks."

On the cross-examination, Winslow made no attempt to break down Caro-line's story. But he did take up her last statement for a minute.

"What makes you seem so sure, Miss Hicks, that Mr. Taylor is guilty of crime?"

"Well, I wasn't," admitted Caroline, "until I knew what day this trial was goin' to be held on."

"What difference does that make?" asked the surprised lawyer.

Caroline lowered her voice dramati-cally so that it was difficult for those in the back part of the room to hear.

"Well," she said, "just as Taylor come a-gallop-in' along on his horse by my house on that night, I felt something shoot by my—my—limbs—going like anything. I jumped and screamed and then I noticed it was nothin' but my old Tommy, and he rushed right across the road in front of Taylor on the run-nin' horse. And you know, my Tommy is a black cat! When I heard his trial had been put on this Friday, Friday the thirteenth, then I knew he was guilty!"

A laugh rippled over the courtroom. The enraged district attorney shouted his objection to the judge and the judge, equally furious, pounded his bench and ordered the witness's last statements to be stricken from the records.

American Agriculturist Crossword Puzzle

Series 2, Number 5

Copyright American Agriculturist, Inc.

An odd diagram and by no means an easy one to fill, if you ask the puzzler who devised it! Those four corners, with no relieving black squares, were regular twisters, but it finally yielded and both the 4-letter and the 6-letter words fitted snugly into place. You will notice that 3, 4, and 6 are the only sizes used.

The School Lunch

A Peep into Polly's Dinner Pail

WE farm women can understand what is meant by "nutrition" when it is discussed in terms with which we are familiar. We've heard our men folks talk about roughage, concentrates, proteins and other necessities of proper cattle feeding, and we are being told that cod liver oil is good for the chickens.

Now at the College of Agriculture, Ithaca, New York, the experts on the feeding of human beings and of the dumb beasts have realized the similarity and are appearing together before audiences to carry the message of properly balanced food rations for the folks on the farm as well as the lower animals.

Perhaps some might think this an unnecessary expenditure of time, but we know some men who see to it that the cows are fed just right, and the calves have their milk properly warmed and the chickens

ness. The first few days all goes well. Polly may not eat all her lunch at noon, but perhaps on her way home she stops to eat the last piece of bread. We find it is an empty dinner pail which Polly sets on the end of the kitchen table when she returns from school in the evening. But alas: in a few days to Mother's surprise she finds a little of this and a little of that. And we hear Polly exclaiming "I don't want this and I don't like that. I never want to see another hard-boiled egg as long as I live." And in a few days the ban is put off something else, until Mother is at a loss to know just what to fix for her.

Nothing is more appetizing than bread that has been soaked to softness with syrup, preserves, or fruit butter spread on it. Try sending such sweets in a glass, letting Polly spread it on as she eats.

For the "Middy"

The accompanying drawing represents a new departure for our Household Department, so if you find this idea useful and instrumental in saving your pennies, we should appreciate it if you would write the A.A. saying as much.

By the use of a sheet of carbon paper, which may be bought at any stationer's, you should be able to transfer directly from this drawing to white tissue paper which can be basted on dark goods, and the design embroidered directly on, trimming off the paper which is left on the outside of the design. If white goods is used, the design can be transferred directly to the goods without the use of the tissue paper. Along with the buttons and braid of a regulation sailor suit are used emblems as here drawn. They are exact size to transfer and embroider—the anchor on dickey or tie; the eagle, with additional bars if you like, on the sleeve, and stars in collar corners. Lines indicate the length and the direction of stitches.

have a warm mash, but the children on these same farms are not even getting their share of milk and no attention is paid to the fact that they should have at least one warm dish at lunch-time at school.

"The most important crop of any farm is its boys and girls" and "Food makes the man." Can anything be clearer than that?

* * * *

A Peep Into Polly's Dinner Pail

WHEN Polly skips off to school these days, let us see to it that she carries with her a sanitary lunch box. The folding ones are best for several reasons: they are inexpensive and will last for a year or two at least; they can be unfolded, spread out flat, washed and aired inside and out; besides, they are light in weight, easy to carry, neat and attractive looking—quite an improvement over the old tin pail that always carries a stale and stuffy odor.

Mothers, the way we prepare our child's lunch has much to do with its attractive-

Cooked or canned fruit or some kind of pudding put in glasses is good. I'm sure you will find her asking for these. A small jelly glass with tightly fitting lid, or a cold cream jar with a top that screws on makes ideal containers for such food. And you will find pretty Polly taking great pains not to break the glass or lose her spoon.

Let us not forget the bright red apple, the yellow orange, juicy pears, peaches, grapes and other fresh fruit. Polly's lunch must be plain and wholesome, rather than rich food. Never send pie and seldom send cake with the school lunch. Children are apt to pick out the knickknacks and eat them first. This often spoils the taste for the plainer foods.

A child eats lunch hurriedly thinking mostly of play and often bolts it. This is why sandwiches and bread put together in varying ways, must form the bulkier part of the noonday school lunch. It is well to seek variety constantly and the child will seldom complain that she "can-

Food and Health

They Go Hand in Hand---Pattern Service

IN no field of science is there a wider range for wonderful accomplishments than in the science of feeding. Every mother ought to consider it her privilege as well as her duty to feed her family as intelligently as possible.

It is not always a matter of money spent; but a matter of common sense, backed by a general knowledge of foods essential to good health, that goes into the making of healthy upstanding young people—normal in mind and morals. And let me say in passing that the mind and the morals are a direct outcome of physical fitness.

How can the mother assure her family of proper foods during the long winter months? Let us consider first what some of the essentials are. Keep this list in mind. Milk; butter eggs; fresh vegetables, fresh fruits. These foods should enter into every child's dietary to insure that child of normal development.

I realize that in winter these foods are harder to procure than in summer,

pensable" ones to my mind—apples and oranges. Apples are usually in abundance on every farm. Oranges can be had comparatively cheap during the winter season. Apples should be eaten daily. If it is possible all the young children in the household should be given orange juice daily. Orange juice is thought of right along in the same plane of importance as milk. Give it to the baby after he is five months old. Just a little, say a teaspoonful mixed with his drink of water. Keep on increasing the amount as the baby grows older. Get the orange juice habit to such an extent that all the young children up to five years old get a little orange juice daily. It helps to make strong teeth, and straight legs and rosy cheeks.

—JOSEPHINE L. PERRY.

not eat this" or that she "doesn't want that any more."

Dresses That Will Please the Young Mother

THE young mother, or the mother to be, needs comfortable, easy-fitting garments, yet she wants to look neat and trim, as well as to have her clothes becoming in color and line. While perfectly suitable for women of all occupations, the dresses shown this week are particularly chosen for the busy little mother. The AMERICAN AGRICULTURIST layette patterns Nos. 1989, 1990, and 1991 (not illustrated) furnish all the garments for the Better Baby. They, too, are 12c each.

No. 2118—Morning frock, sizes 36, 38, 40, 42 and 44 inches bust measure. The surplice closing allows for adjustment as desired. Size 36 requires 3 yards of 40 inch material, with 3¼ yards of braid. Pattern, 12c.

No. 1995—Child's one-piece smocked dress, with short kimono sleeves. Size 6 mos., 1, 3 and 5 years. The one year size takes 1½ yards of 36 inch material. The smocking in a delicate color is pretty. Pattern, 12c.

No. 2251—A surplice dress with soft shoulder and skirt pleats, cuts into large sizes to please the older woman, too. Sizes 36, 38, 40, 42, 44, 46, 48 and 50 inches bust measure. Size 36 takes 3½ yards 40 inch material. Pattern, 12c.

TO ORDER: Write name, address, pattern numbers and sizes correctly, and enclose correct remittance, stamps preferred (coins sent at own risk) and send to Pattern Department, AMERICAN AGRICULTURIST, 461 Fourth Ave, New York City.

but with careful planning the thrifty housewife can see that her family gets milk and butter every day; eggs several times a week, and some sort of fresh vegetables and fresh fruits every day.

Cabbage is the good old standby. Serve it raw. Cooking destroys the vitamins for which it is so valuable. Celery can be usually had on the farm. It is as valuable in the dietary as cabbage, if eaten raw. Canned tomatoes can be substituted for raw vegetables, as tomato is the one vegetable that holds on to its vitamins regardless of how it is treated.

Have you ever tried making sandwiches of grated carrot, ground nuts, and celery? Use equal parts of each. Mix with salad dressing and spread between thin slices of graham bread. It makes a splendid sandwich for the high-school girl, and has in its favor the utilization of two raw vegetables. By the way, do not discourage small sons from crunching raw carrots and potatoes. They are beneficial rather than harmful.

In thinking of raw fruits two "indis-

Those of us who live in a land of plenty dislike to have it said that the rural boys and girls are so much more underweight than the boys and girls of the cities. Nevertheless, the disagreeable fact is quite true. The nutrition clinic work that is being carried on in one of our schools by health organizations of the various states, is bringing some startling facts to light. An underweight child cannot develop either physically or mentally at the normal rate. Is it not then our duty as parents to see that the right kind of food is supplied at school as well as at home? It is important that Polly carries with her school lunch a pint or half pint bottle of milk. A couple of straws such as we find at soda fountains should be neatly wrapped and placed beside the bottle. Drinking milk at the morning meal, and the afternoon recess is another means of bringing underweight children up to standard.

Serving hot dishes with the school lunch has been tried in several states, and has been found to be very successful.

Service Department

When Buying a Farm Get Disinterested Advice

I wonder if we could bother you a little. We have been wanting some inside information about New York farms, and yesterday noticed your name in American Agriculturist and wondered if you could tell us what we want to know? We have been thinking some of locating in New York and want to find out all we can on both sides, so far we have only heard from Farm Agencies and of course they tell the advantages without telling the disadvantages. Some of their claims are too big to be true, or else there is something terribly wrong. We do not know how to offset it, for instance, one named several thousand cords of wood on a farm and it had ready sale at from \$7 to \$14 cord, beside valuable timber. Now what we want to know is what is the matter? Is the land so poor, and taxes so high that farmers cannot pay them? We think they are bad enough here, but according to the price they must be over twice as high there. What is that fire protection? If it was scarcity of help on these farms so cheap we would not be afraid to try one as we have a large family of boys and have plenty of help, we have to look out for a place where there are good educational advantages. Where would you advise us to locate? Or would you advise us to come at all? Are you acquainted with farms in around Raven and Albany or down around Binghamton? If so, what do you consider their disadvantages? Is there lots of high roads there and is the winter so severe and so much snow one cannot get the timber out? Could you tell us where to get a copy of the Game Laws for New York and is there much hunting? We want to get a farm suitable for sheep if we do make a change. We are not much for dairying. Now I like to bother you with such a lot of questions, but do want to hear from someone who would tell us the real truth and will be so thankful if you will answer this. W. W., Ohio.

When this question came in we answered part as follows and then sent it to Mr. Burritt to also answer it.

Dear Mr. W.: If you have a little capital that you can buy your farm and have enough left to equip it and tide over the next two or three years of possibly hard times, there is no time in many years when, in our opinion, you could make a better buy in New York State farms than at the present time.

There are many splendid farms for sale; good locations and good buildings at much below their real value. This is because farmers are discouraged because of the temporary hard times. It is a matter that needs the best judgment in the work and one should be taken not to accept real estate dealers statements at 100% value because they are probably too enthusiastic. It is simply human nature to put the rosy side out when trying to make a sale.

We might make additional suggestions that you pick out the section of New York State where you think you would like to locate and then write to the County Agricultural Agent in the particular county and get his advice as to the kind of farming, the value of real estate and other matters which you ought to be informed before you buy.

Mr. Burritt on Buying Farms

I have your letter of February 13th and apologize for not answering it sooner. Too many necessary things to do is my only excuse. I am glad to try to answer your pertinent questions.

In the first place you must realize that New York State possesses highly diversified and variable soils, elevations, roads, locations and in reference to markets, etc., especially in Southern, Eastern (Raven and Albany) and south central New York (Binghamton). These conditions are so variable that one cannot generalize even for the same community. Unless the valley farms are very good and the hill farms rather poor; but there are good farms on the hills. One should never buy a farm from a farm sales agency without seeing the farm and consulting others. Write to the State College of Agriculture at Cornell University, Ithaca, N. Y., and the County Agricultural Agent in the county in which you think to locate. Get the names of responsible farmers there and consult them. There may be good bargains and poor purchases of farms in these sections within two miles of each other. You cannot investigate too thoroughly.

Many of the claims of salesmen are no doubt true, but as you say they tell only part of the truth—the favorable part. The soils of many of these cheap farms are very poor, badly run down by poor farming. It would cost more to build them up, than the purchase price, and present farm prices don't warrant the cost. They are

often marginal farms. Labor is especially scarce and high because of proximity to manufacturing centers. The farmer can't afford to hire. Even at the prices cited for wood there might not be much to it if you had to hire it cut and delivered. Taxes are very high. Many farmers are literally being taxed off their lands by inequitable real estate taxes, to pay for bonded indebtedness for roads and other public improvements, schools, etc. etc.

On the other hand much of this country is an attractive place in which to live. The scenery is beautiful, there are fine roads in most of the main valleys. The educational facilities in many of the thriving villages and cities are unexcelled. Markets are at the very door. Good crop yields may be obtained and it is a natural well-watered livestock country. It is not so important where you locate in the State as it is where you locate in a county and a community. See the farm and get competent disinterested advice before you buy. Don't buy the poorest and cheapest at all.

The winters are usually moderate, though sometimes severe for short periods. You can usually get wood out without much trouble. Winds are not often troublesome except on certain locations. You can get copies of the Game Laws from the State Conservation Commission, Albany, N. Y. There is some good sheep land. Mr. Mark Smith at Burdett, N. Y., who is sheep editor for AMERICAN AGRICULTURIST, could give you some good suggestions about sheep in New York. —M. C. BURRITT.

He Could Foreclose

On July 8th, 1924, I purchased a place in New Jersey and have made every payment on said place when due; except the 8th of January, 1925, when the interest was due on principle. Said interest was to be paid every three months. I met with an accident and was unable to meet this interest. I wrote to party whom I am purchasing from and stated this fact and asked for an extension of time, but I have not heard from this party. I was buying this place on the installment plan, paying so much down and so much per month, but have no papers except the agreement typewritten and signed by myself and party who is selling. Can this party foreclose on me? I have this place rented till April 25, 1925. Can this party make me return same?—Mr. G. H. B., Pa.

UNLESS you secure an extension agreement, it is our opinion that the person holding the mortgage has a right to foreclose for non-payment of interest. A mortgage usually so provides. We suggest, therefore, that you call upon the mortgagee and endeavor to arrange in writing for the extension. He will probably do the reasonable thing.

As to your present tenant, it seems to us that foreclosure proceedings would result in his ejection. We are sorry to report to this effect, but that seems to be the present status of the law.

Who Cuts the Weeds

A and B own adjoining property separated by public highway. A's deed calls for all the highway because highway was bought by town off farm now belonging to him. B's deed only calls for land inside fence. The question has been argued as to who is responsible for cleaning roadside adjoining B's property. Would there be any exception to general highway law in this case? B's tenant agrees in lease to keep the roadside clean but refuses to do so because he says his lawyer tells him A is responsible for care both sides of highway. What stand can B take in regard to question both with A and with his tenant?

The Highway Law provides that the owners of land abutting on the highway shall cut the weeds at certain times in the year. In our opinion, it makes no difference who owns the fee of the road-bed, that is, it matters not that all of the road was taken from A's farm.

The Law says that abutting owners shall cut the weeds. B is certainly an abutting owner, and it seems to us he is responsible for cutting his side of the road.

To clean oily machinery thoroughly, take one gallon of water, and add to it one-half pint of lard oil. Mix them thoroughly, forming an emulsion. Rub the painted surfaces with the compound and remove it before it dries, with a cloth.

At your service

The courteous girl at the switchboard speaks the first word in more than two million conversations an hour. Presiding day and night at the busy intersections of speech, she is always at the call of the nation's homes, farms and offices.

Out of sight, and most of the time out of hearing of the subscribers, little is known of the switchboard girl—of her training and supervision under careful teachers, and of her swift and skilful work. Likewise, little is known of the engineering problems necessary to bring the terminals of sixteen million telephones within the reach of a girl's arm, or of the ceaseless work of maintenance which in both fair weather and storm keeps the mechanism fit and the wires open.

America's millions of people must have at their command means of direct and instant communication, and the Bell System must ever be in tune with the demands of national service.

These are the components of America's system of telephony: The best of engineering, of manufacture, of facilities—and a personnel trained and eager to serve.

NO MONEY DOWN!

No C. O. D.—Nothing to Pay on Arrival for This 110-Piece 18-Carat Coin Gold Decorated DINNER SET

Not a penny now. Just mail the coupon and Hartman, the Largest Home Furnishing Concern in the World, will send you this complete 110-piece 18-carat coin gold decorated Dinner Set with your own initial in beautiful harmonizing colors on every piece. Read the sensational offer, then send for this marvelous set while special bargain price holds good, and receive with it, absolutely FREE, the beautiful 26-piece Silverware Set, made exclusively for Hartman's by WM. A. ROGERS, Limited, initialed to match dinnerware. Each dish is stamped genuine "18 Carat Coin Gold." It's easy to get this set from Hartman. Nothing to pay for goods on arrival—except small transportation charge. No C. O. D. Use both sets 30 Days on Free Trial, and if not satisfied send them back and we will pay transportation charges both ways. If you keep them, pay only for the dinner set—a little each month.

Very Important

Hartman guarantees that every piece in this set is absolutely first quality—no "seconds." The 18-carat coin gold decoration is guaranteed not to wash or wear off—unlike the common gold decoration used by others on dinnerware. This is a standard or "open" pattern. Replacement pieces may be had of us for three years. Excellent packing to prevent breakage.

FREE 26-Piece Initialed Silverware Set

YOUR OWN INITIAL ON EVERY PIECE

You also get this beautiful 26-piece Initialed Silverware Set, made exclusively for Hartman's by WM. A. ROGERS, Limited. 6 knives, 6 forks, 6 teaspoons, 6 tablespoons, 1 sugar shell, 1 butter knife. Every piece has your own initial to match dinnerware.

FREE Bargain Catalog

Hundreds of pages, many in actual colors, of the world's greatest bargains in furniture, rugs, carpets, draperies, sewing machines, silverware, watches, etc.—all sold on easy monthly payment terms and 30 days' free trial.

FREE GIFTS

Book explains how you get Glassware, Silverware, Jewelry, Table Linens, etc., Free with purchases.

"Let Hartman Feather YOUR Nest"

Newest and Finest in Dinnerware! Blue and 18-Carat Coin Gold Richly Decorated Both Sets Have Your Own Initial on Every Piece

Not only will you be charmed beyond measure with the beauty of this exquisite ware itself, but you will be delighted to have your own initial on every piece in beautiful colors and design, surrounded by gorgeously colored decorations. All handles covered with genuine 18-carat coin gold and each piece also has an 18-carat coin gold border and rich blue follow band. A set your family will be proud of and your friends will envy.

FREE—Initialed Silverware Set to Match! Made by WM. A. ROGERS, Limited

We will ship the Dinner Set complete and with it, FREE, the 26-piece initialed Silverware Set, made exclusively for Hartman's by WM. A. ROGERS, Limited, with initial to match the initial on dinnerware. If not satisfied, after 30 days' trial, return both sets and we will pay transportation charges both ways. Otherwise, take nearly a year to pay for 110-piece set only—a little every month. Pay nothing at any time for Silverware. Be sure to give initial wanted.

Order by No. 322GMA19. Bargain price of 110-Piece Dinner Set, \$39.98. No Money Down. \$4 Monthly. Silverware Set is FREE.

"Concrete on the Farm," a book containing 98 pages of practical information, will be sent free at your request. You should have a copy to keep for reference, as it tells in simple words how farm labor can do much of the smaller concrete work that means protection and economy to you.

Concrete today is not only the safest but the most economical farm building material. Since The Atlas Portland Cement Company developed the rotary kiln, Portland cement has become the cheapest of all manufactured products.

ATLAS QUALITY IS PROVED

For over thirty years Atlas Portland Cement has been used on the farm. When you get Atlas from your dealer you get the same high quality that was proved in the building of the Panama Canal. More than 8,000,000 barrels of Atlas were used at Panama, and not a single barrel was rejected—though government tests of the cement numbered over 75,000.

Learn of the uses to which you can put Atlas Portland Cement. Get a free copy of "Concrete on the Farm." It will probably show you how to add definitely to the negotiable value of your property.

How We Handle Manure

A Plow Handle Talk

MANURE handling at our

By H. E. Cook

place is generally a pretty methodical affair; that is in the winter it is. A larger part anyhow is drawn and spread each day. This winter it has been different and most of it has been piled. Deep snows followed by a month of open weather has been the reason. A still further reason has been that we needed some extra manure this spring on land that usually would have used on it a mixture of chemicals. But we

have a large amount of stable manure and this plan would lessen the fertilizer bill or nearly cut it out. Our hay crops are good ones and the final effect of our added fertility is to grow more hay. Its value is so low and we have a surplus anyway that here is no profit in buying plant food to grow a crop I cannot

sell. I am writing this paragraph chiefly to illustrate that methods cannot always be standardized, and then each of us may have plans that fit our particular needs and we cannot conform to those of others.

Top Dressing With Manure

Our business is to produce milk and the hay crop is its backbone and one can carry a field a considerable length of time by top dressing with stable manure. One can, and sometimes we do, top dress in the winter direct from the stable but that means hand spreading and it does not compare in results to a manure spreader application in the fall, using the same quantity in each case and so where much bedding is used I think the gain is more than the losses in piling during the summer. As a rule we do not get the best kind of hand spreading in the winter.

Many days are cold and stormy and our men feel as I do when doing the same job—we want to get back to the barn as quickly as possible. Poor spreading on a newly seeded meadow will not do much harm because alsike and red clover will push up through, but timothy plants cannot do it. Alfalfa after the first year will do better. Top dressing has a very marked effect on our soils in carrying alfalfa because our subsoils do not permit of deep rooting.

Soils Need Water Carrying Capacity

Then again kinds of soils have to do with methods. Any system of handling that will stop up the excess of air spaces in sandy soils and make more air spaces in a clay soil is good practice. Mechanical effect may be of as much value as the plant food value and until these soils have taken on the loamy texture we must reckon with this requirement. The best soil for any crop is the one that has water carrying capacity. Both sand and clay lose water in a drought and fertility amounts to nothing without water. An understanding of a few fundamental principles of soil handling and of manures plus a lot of hard study in order to adapt them to our own farms and methods of farming will be worth a lot more than written details. We must know what our manures are worth. Only about one-half of the actual plant food in a given quantity of feed finds its way into plant structure. The animal takes her toll of not less than 25%, and 25% is lost in handling, and lack of availability.

Then again we must not forget that wide rations and light feeding of concentrates makes for low value of stable manure, however careful we may be in handling.

A Good Soil Means a Good Living

We must remember also that rank feed-

ing plants like corn can use coarse green manure, while the smaller surface feeding plants must have decomposed more readily available plant food. Actually, one can hear more discussion over automobiles and one day late on the arrival of the milk checks than upon some of these great fundamental principles of farming. Of course, one does not want to think seriously every minute of the day, but at least we must not sidetrack these fundamental things upon which success must hang. It is, of course, valuable that the Dairymen's League or any one of the hundred other things going on around us succeeds, but it is much more important that your farm or mine is productive and gives us uniformly good wholesome returns each and every year. This is a very life-giving matter, affecting our debt paying power, our happiness, contentment, good living, the education of our children and their future welfare which is, if I am thinking along right lines, about what we are placed here to do.

Good Soil After 4,000 Years

We would be chagrined if compared to the Chinese in our methods of soil care and yet they have maintained soil fertility and the production of human food better than we are doing. King gives an illustration of a district where 36600 people live on and grow their food on one square mile of land and the soil has been cropped for 4000 years.

To be sure, land has been our one big asset and population sparse, and manures have not been so important, but some day we shall have to wake up as we have had to do in the development of new forests. We need manure schools as much as we need gas engine schools if I guess aright, and no one needs them more than does the dairy farmer who more and more sends fertility to the sewage departments because we have an increasing demand for fluid milk.

Handling manures is expensive and labor is our highest priced article and we should handle it the least possible. Under average conditions, dairy farmers have an advantage of direct to the soil application. Sometimes, however, our methods of waste seem to warrant a feeling that because it is common and dirty it is correspondingly cheap.

Do not let us get the notion that because we have more crops than can be sold at a profit that the day of manure conservation has passed. A productive soil always has been and always will be the true measure of a successful agriculture.

How Can We Pay the Taxes?

I WANT to congratulate you on account of the noble work you have started to do for the farmers. Whether or not you succeed you should have the best wishes of every farmer in the country because that tax item is something that touches a sore spot which is plain to be seen. The National Grange stated not long since, the farms of the U. S. were mortgaged to \$14,000,000,000. The farmer as a rule pays no less than 5% interest and from that up probably to 8% he also pays a tax on the property he does not own.

To me it seems to be the real source of all the farm troubles. The farmer is driven to get what he can and take what he can get to meet pressing expenses all the time.

No doubt but you will be able to make it plain to your legislators that it is time to draw the line and cut expenses, but the only way the farmer will ever succeed in that line is to watch the vote and follow the prohibition plan in nailing the fellow at the next election if it can be done.—N. The Revolution in Corn Breeding

Single and Double Crosses of Inbred Strains of Corn Make Record Yield

By H. A. WALLACE

Editor, Wallace's Farmer

THE revolution in corn breeding began back in 1905, when E. M. East, an Illinois boy, began inbreeding some Leaming corn at the Connecticut station.

Perhaps East became interested in corn originally by associating with Hopkins and Smith at the Illinois station. At any rate, when he got a job at the Connecticut station, he evidently decided to

forget all about ear-row breeding and other methods which were so popular in the corn belt at the time. He was a scientist, and therefore he stuck out boldly into a new field. He bagged the silks and tassels of his corn and by hand put the pollen of a plant on the silk of the same plant.

He not only did this one year, but for several years.

Within a few years the inbred corn became discouragingly weak, and some of the strains were so very bad that they died out entirely. The best of them yielded less than half as much as ordinary corn. East then crossed these inbred strains and found that the original vigor and yielding power came back, and more, too. This was announced to the scientific world in 1910, and created something of a stir, but nothing came of it directly. George H. Shull, of the Carnegie Institution, did the same kind of work as East, beginning in 1905, and also announced his results, which were the same as East's in 1910. East's work is of more interest because his inbred strains are still in existence and have given combinations of high productive value when crossed.

Others Take Up the Work

East went into purely scientific work at Harvard and a young fellow by the name of Hayes took up the task of continuing the inbred strains which East had started. After a few years Hayes was called to head the plant breeding work of the Minnesota station, and a Kansas boy named Jones came in charge. Jones thought that if breeding two inbreds together was good, that maybe it would be still better to breed four.

This double crossing, as he called it, gave astonishing yields. Double-crossed strains yielded 100 to 120 bushels per acre on the same soil where standard Connecticut varieties were yielding 80 to 90 and the inbred parents less than 40 bushels. Jones fairly bubbled over with enthusiasm and wrote a number of interesting bulletins and articles during 1918-22.

At the same time other scientific men, notably those at the Nebraska station and in the United States Department of Agriculture, began to take a vivid interest in inbreeding work. For a number of years these men had done inbreeding work, but apparently with no great hope of a practical outcome. All of this suddenly changed, and by 1923 every experiment station in the corn belt was actively at work on the new idea.

No seed company, or farmer, or experiment station, has any inbred seed or cross of inbred seed for sale today. The revolution has not come yet, but I am certain that it will come within ten or fif-

teen years. A foretaste of it was in the south-central section of the Iowa corn yield contest last year, when a cross of three inbreds outyielded the nearest strain of Reid corn by 30 per cent. It is safe to say that if this cross had been planted in the Reid Yellow Dent territory of Iowa last year that the average farmer would have had 500 bushels more corn and the state total would have been increased by fully 50,000,000 bushels.

A Cross That Reduced Moisture

The story of this particular cross is interesting. Holbert, working for the United States Department of Agriculture, on the root-rot problem in corn, started inbreeding work with Funk Yellow Dent about six years ago, finding two vigorous strains which he called his A and B strains. Holbert found that a cross of these two strains yielded unusually well in central Illinois. Jenkins, who worked with Holbert at Bloomington, went to the Iowa station at Ames in 1922, taking with him seed of this cross. In the meantime, at Des Moines, I had been inbreeding Burnett's Iodent, which is the Iowa station strain of Reid. To hasten matters along I produced two generations a year by using a greenhouse in the winter. This particular inbred was unusually bad, producing some plants with striped leaves, some with rolled tops which wouldn't let the tassel come out normally, some with zig-zag stalks, and many plants seriously affected with root-rot. It was early, however, and produced ears with nice, horny kernels. One of the graduate students at Ames wanted to experiment with some inbred strains of corn, so I sent this up to him.

Burnett tells me that Holbert's A by B cross was crossed on this inbred Iodent and part of the resulting seed was planted in the Ames plot of the Iowa corn yield contest in 1923. It outyielded the nearest strain of Reid by eight bushels to the acre, and so in 1924 the rest of the seed

was entered in all the plots of south-central Iowa in the regular way, and this time the cross had a lead of more than ten bushels per acre over the nearest strain of Reid. Moreover, it contained only 14 per cent moisture, as compared with 19 for the typical Reid strain.

Next to this particular inbred cross in the 1924 Iowa corn yield contest was a red inbred cross which yielded eleven bushels per acre more than the average of the thirty-two Reid strains entered. This sort is of particular interest because on its dam's side it is one of the inbred Leaming strains started by East back in 1905. The sire is a Bloody Butcher originally from China, inbred one year by Richey of the United States Department of Agriculture, and then by myself for two or three years, one generation being in the greenhouse during the winter. The inbred dam which was detasseled in 1923 was seriously attacked by diplo-dia and the seed which was planted in the corn yield contest was the poorest looking seed corn that was ever planted in Iowa. Nevertheless, the punch was there, because it outyielded thirty-two strains of Reid corn, including such well tested strains as the Krug, Black, Steen and McCulloch.

Problem to Find Best Inbred Strains

The problem now is to find the very best inbred strains of corn. So far, the strains used have been more or less makeshifts, and I am certain from studying the work of Hoffer at the Indiana station that they can be greatly improved upon. Just the same there are ten or fifteen strains in existence today that combine sufficiently well that if we used nothing but them, I am certain that the corn yield of the corn belt could be increased at least 100,000,000 bushels annually. The extra cost of producing seed by this method is perhaps \$1.50 a bushel, which would add roughly 25 cents an acre to the cost of seeding. The average farmer, however, will not care to go to the bother of producing seed of this sort himself, but will doubtless prefer to buy it each year from seedsmen or local seed corn "cranks" at the total outlay of perhaps 50 cents or even \$1 per acre for the improved seed.

Gives Unusual Yield But One Year

This investment must be made afresh each year, because this cross of inbred seed will give its unusual yield only the one year. Of course a return of five or ten bushels is very good for an outlay of fifty cents or a dollar, but it will doubtless take a lot of educational work before many farmers will care to buy the new type of seed corn fresh each year. When the revolution gets well under way, a number of new things will develop. Types of corn will be put out which will not blow down in any ordinary wind-storm, but at the same time yield well. High yielding ninety-day sort will be especially adapted to corn picking machinery, with strong shanked ears which will not drop off until pulled off by the machine. Certain sorts will excel our present-day strains in the fattening of hogs and cattle. Others will be especially adapted to seeding clover or wheat in the corn.

The average bushel of corn as produced in the corn belt now requires, in a

(Continued on page 338)

STANDARD FARM PAPER EDITORIAL SERVICE

This is one of a series of special articles by the members of the standard Farm Paper Editorial Board. The members of this board are as follows:

H. A. Wallace.....Wallaces' Farmer, Des Moines, Iowa
C. V. Gregory.....Prairie Farmer, Chicago, Illinois
D. A. Wallace.....The Farmer, St. Paul, Minnesota
Clarence Poe.....Progressive Farmer, Birmingham, Alabama
Donald Kiefer....Pacific Rural Press, San Francisco, California
E. R. Eastman.....American Agriculturist, New York City
T. A. Leadley.....Nebraska Farmer, Lincoln, Nebraska
John Cunningham...Wisconsin Agriculturist, Racine, Wisconsin
A. J. Glover.....Hoard's Dairyman, Fort Atkinson, Wisconsin
De Witt C. King.....Breeder's Gazette, Chicago, Illinois

H. A. Wallace, editor of Wallaces' Farmer, in this article summarizes the history of the inbreeding of corn as a method of developing high yielding strains. A practical corn breeder as well as a student of genetics, Mr. Wallace is able to show just what the use of this method will eventually mean to the corn grower. Inbred crosses developed by Mr. Wallace ranked high in the Iowa corn yield test last year.

The Tax Fight At Albany.

SINCE we went to press with our last issue, we have been in Albany getting first hand information about tax reduction and putting the farmers' need for tax relief again before the leaders in the legislature. One of the worst rows in years has been in progress for weeks among the leaders at Albany on the question of tax reduction. The Governor and some of his followers are making a fight for a reduction in the income tax while the leaders in the legislature are standing for holding the income tax where it is and if there is any relief to be given, they are for reducing the direct tax on real estate.

We have a lot of admiration for Governor Smith and believe that he has been right in many of the things he has been fighting for, such as consolidation of the State Departments and an executive budget; but we think he is wrong on this question of tax relief. As a matter of fact, it is a question of the cities lined up against the country. The cities want income tax relief while the farmers need relief on farm real estate.

Let us consider the justice of this for a moment. Suppose that you own farm real estate assessed at \$8,000, while your brother who is a city man has a yearly income of \$8,000; suppose—and this is the case with nearly every farmer—that this \$8,000 has paid practically no income during the past year. Who, in all fairness, is better able to pay, you or your city brother? Of course, if the time comes so that your property produces an income of \$8,000, that is a different matter and you should pay.

In other words, the only correct, honest and fair principle of state taxation is on *income* and not on *property*. It is adding insult to injury for a man to stand a loss on the operation of his property and then to have to pay a heavy direct state tax on it besides.

A bill is before the legislature at the present time appropriating \$9,000,000 for the relief of rural school taxes, the largest relief to go to the poorest districts where the taxes are the highest. It looks now that if the income taxes are reduced as proposed, this appropriation will not pass.

A bill is also before the legislature appropriating \$4,000,000 to pay for condemned tubercular cattle. Cleaning up the bovine tuberculosis helps not only farmers but every citizen in the State by insuring them good and safe milk. In order to save money for reduction of the income tax, it is proposed to cut this appropriation in half and to make up the deficit by another appropriation next year. If this were done, it would not interfere with the progress of eradicating tuberculosis but it would simply pile up the obligations of the State to be met by further taxation next year.

We have told the legislators repeatedly lately that there has been a lot of fool legislation proposed for farmers which, if passed, would do more harm than good, but that here was their opportunity in the reduction of direct state tax to do something practical and worthwhile for agriculture.

We think that every farmer, therefore, should watch carefully the vote on this important issue and note whether or not his Senator and Assemblyman failed him in helping to get relief for the farm taxes.

The Expected Has Happened.

FOR a long time those economists who make a business of studying conditions that influence farm prices have been saying that the high prices for wheat and other grains could not continue. They were right. During the last two weeks, the bottom has fallen out completely from under the wheat prices with the worst break in the history of the market in normal times. In two weeks the price of wheat dropped 51 cents a bushel and other grains also followed with bad breaks.

Fortunately, the wheat was mostly out of the farmers' hands so that the loss came on the speculators and not on the farmers. But Western farmers again face a serious situation for next year. Here in the East, we are more fortunate. We are chiefly dairymen and poultrymen and are therefore great consumers of feed, and feed is already considerably cheaper than it was.

Last year, we heard considerable talk about western prosperity while here in the East low milk, potato and cabbage prices made pretty hard times. But the situation has almost completely changed in the last few months. Prices for milk during the winter have been fairly good, and there are signs that they are likely to continue fair throughout the season. The same can be said for egg prices, so taking it all in all, while there is every reason to be careful, there is also cause that the old reliable standbys of dairy and poultry, helped out by a few cash crops, are going to make out pretty well this year.

All of which leads us to say again that while some folks, particularly at Washington, think that there is no farming in the country except in the Central West, taking it over a period of years, we will take our chances on a good Eastern farm every time.

The Need for Farm Papers

THERE never has been a time in the history of agriculture when farmers needed the help of independent farm papers as they do right now. We do not believe in stirring up or stimulating the more or less bitter feeling that already exists between country and city, but we do know that on many important issues city folks line themselves up against farmers and as there are more of them, it is important that the farmers have some agencies such as the cooperative organizations and the farm papers to stand up for their rights. This has been impressed upon us especially lately for it would seem that every time we pick up daily papers we find them advocating something that will help the city and harm the country.

For instance, in a great New York City daily of recent date there was a long editorial entitled "The Good New Summer Time". In this editorial it said:

"General conformity with the improved system by town and country would be desirable, but the rural reaction is undeniably hostile. A good many of the farmers not only refuse to save daylight but would, if they could, prevent anybody else from doing so, or at any rate would not permit the clocks to aid and abet the economy. Last year at Albany they attempted to repeal the statute permitting cities to adopt daylight saving. Fortunately that churlish attitude did not appeal to the Legislature. The effort to coerce the cities has not been renewed."

Then there comes the question of the farmers' taxes and again we find the city papers, both Republican and Democratic lined up against the farmers and their interests, and against the legislators from up-state on the tax question. The city is interested only in having the income taxes reduced and it seems to matter little to them whether the farmer

gets any help or not.

The great city dailies speak for the city men. It is imperative that the farmers have fearless, farm journals, bound to no particular interests, to work with their other agencies for those things which in all fairness they must have if agriculture is to survive.

Watch Your Seed

OF forty-one samples of bulk seed corn tested in the seed laboratory at the Experiment Station at Geneva, New York, in one week recently, the germination varied from 100% from old corn saved over from last year to 28% for new corn. The average for all samples during the week was only 78%, and corn specialists say that seed corn should germinate at 99% to be worth planting.

This makes a very serious situation. If farmers do not watch out, there are going to be a lot of poor stands of corn this year. In any ordinary year, and particularly this year, no seed of any kind ought to go into the ground without being tested. Think of all the time and the money lost and the general discouragement of preparing the ground and sowing the seed only to find when it is too late that the crop will never be successful because of the poor stand.

Testing seed for germination is a very simple process. Any boy or girl can do it, and it is a lot of fun. On Page 338 there is a brief description and a picture showing how to test by the so-called "rag doll" seed tester. Do not miss this little article, and particularly do not miss testing your corn and your other seed. If you do not want to bother about testing at home, ask your county agent to do it for you or send samples to your State College of Agriculture. The State will test them free of charge.

Auto Thieves Even In Winter

AT least during the wintertime, farm people have the right to expect a little rest from the automobile hogs, but such does not seem to be the case. A few days ago on Mr. Morgenthau's farm, some men came with a large truck and without asking anybody's permission, cut and carried away a great truckload of pussywillows. Of course, in this particular instance, there was probably not much damage done, but the principle of the action, or rather the lack of principle, just naturally makes any red-blooded man indignant. Some of these automobile hogs have such an utter disregard for law and the rights of others that they bring owner of a big car into more or less disrepute and under suspicion.

They remind one of the old story of the thieves who came in the night and stole the machinery from the mill. The next night they came and took down the mill itself and carried it away; and the third night they came back for the dam, and were met with a charge of buckshot from the owner which at least temporarily discouraged their operations!

Eastman's Chestnuts

ON the opposite page are several of the fine letters contributed by men who took part in the contest for the best letters on the subject "My Ideal Wife". Among the many letters contributed, there were several amusing ones, and one man sent in with his letter the following story, meaning it perhaps as an example of what an ideal wife ought not to be.

A New York man, who was accustomed to taking hunting trips in the Adirondacks, partly for relaxation and partly to get away from an exacting and somewhat jealous wife, was the sad victim of a blundering telegram.

His favorite guide and companion on this occasion was named Mahoney. Having remained away longer than he expected, he telegraphed his wife, "Ah! having the time of my life, Mahoney is with me".

Imagine the results when his wife read, "AM HAVING THE TIME OF MY LIFE, MY HONEY IS WITH ME".

"My Ideal Wife"

Prize Winning Letters—Here Is Your Chance, Girls

MY ideal wife must possess good judgment, and a sense of humor. Being my wife would vouch for the former and possibly the latter, too. I would not expect her to smile sweetly and avoid all outbreaks, when every blamed thing went smash; but I would like an understanding, friendly grin as she helped me pick up the pieces.

I would not insist that she meet me at the door with a kiss (that is how they detect it), but I would be mighty disappointed if I did not hear her cheery "Hello there, Jim" from some part of the house. Naturally, I would like her to be healthy, but should ill health come, not make a fetish of it, or become a tyrant of aches and pains, spreading gloom all over the place; but on the other hand, make the most of the pleasures she could still have. I want her to be fairly ambitious but not a driver; neat naturally, not painfully so. Above all, chummy—one who will take off her apron and jump into the car with me and run into town any time. I would like her to be interested in the crops, and livestock, with a knowledge of values; but who will not hold post mortems on all of my failures.

Summing it up, my ideal wife is my congenial comrade and pal, who may disagree with me, may not always approve of what I do, but who will love me and stick through thick and thin.—K.

* * *

Motherhood Is the Highest Ideal.

THE real of anything seldom reaches the ideal; so my ideal wife is far above the average wife. She must be the daughter of a good mother; she must have good health, weigh 150 pounds, and be five feet six inches high, and preferably be a blonde. She must be good-looking, neat, intelligent, lovable and loving, and well educated.

She must take an interest in all my affairs. She rejoices with me in prosperity and sympathizes in adversity. She doubles my joys and divides my sorrows. She enjoys company but is happiest with her husband and children around her own fireside. She never acts in a way to cause her husband to be jealous. A light wife makes a heavy husband. Of earthly goods the best is a good wife; a bad, the bitterest curse of human life.

The highest ideal of a good wife is motherhood. The good wife who is not a mother would be a better wife if she were a mother. The sweetest, saddest picture in Van Wagenen's beautiful story is where the mother was murdered while holding her babe in her arms.

Others can wash and cook and rake hay and milk cows. The ideal wife will do those things if necessity demands it; but only the mother can be queen of the home.—B. (Note: This man writes that he is married and a grandfather.)

* * *

Across the Breakfast Table.

THIS should be easy with the correct answer before me, for I was lucky enough to marry what I considered—and thank Heaven I still consider—my ideal. Of course as the old Indian remarked: "No two men think alike or they would all want my

squaw," but I would like to say to the unmarried men that if they choose some girl with the following characteristics, they will have ninety-nine chances out of a hundred of being happy.

My ideal is not beautiful but she is very easy to look at—just as easy across the breakfast table as at a formal dinner. Her complexion, like her

Announcing the Prize Winners.

ON this page are the prize winning letters on "My Ideal Wife." The first letter wins the prize of three dollars, the second, two dollars, and every other letter published will receive a prize of one dollar. We hope to find room to publish some more in a later issue. We had a very difficult job in judging these letters. Probably there were others that were just as good as those we chose for the prizes, but we did the best we could, for we received a very large number, almost all of which were excellent, and very much worthwhile reading. Do not be discouraged if you did not succeed this time, for we will hold these contests from time to time, and maybe you will get in under the wire next time.

We want to take this opportunity of thanking you for your effort.

Any girl might well give consideration to the points raised in these letters by men on what they like in women. In reading all of the letters, we were much impressed that when it comes to picking out a life partner, men do not care so much for beauty of face as they do for beauty of soul and spirit. A pretty face may be all right as a secondary consideration, but if it is not backed by the old-fashioned fundamental virtues, no happiness can be built upon it. No girl who fails to cultivate those same fine things of character and of living which were admired by our fathers and grandfathers can hope to win the lasting admiration of the sons of the present age.—The Editors.

refinement, comes from within and is not applied on state occasions. She laughs more often with me than at me. She is a good mother, a good housekeeper, can discuss our business interests intelligently; and lastly, I know beyond a doubt that whatever and wherever I may find myself at, say fifty, she will be by my side, always an asset and never a liability.—B.

My Ideal Wife

By W.

I want a wife without bobbed hair,
Who will keep my clothing in repair,
And teach the kids to say a prayer,
MY IDEAL.

* * *

Who, when I come home from my toil,
Will greet me with a pleasant smile,
A kind word for me all the while,
MY IDEAL.

* * *

I want a wife who doesn't swear,
And never goes with uncombed hair,
And never has a fretful air,
MY IDEAL.

* * *

I want a wife who's bright and strong,
Will teach the children right from wrong,
God fearing and with happy song,
MY IDEAL.

* * *

I am not particular about her size,
The color of her hair or eyes,
If she is only good and wise,
MY IDEAL.

* * *

I want her for a pal and wife,
Who'll cleave to me throughout her life,
In health and sickness, storm and strife,
MY IDEAL—MY WIFE.

Wants a Good Sport.

IN my opinion the ideal partner for any venture is dependable. He should clearly understand the nature of the business involved, and be willing to assume responsibilities arising from it. He should expect to contribute according to his ability toward the success of the partnership; and should be entitled to the satisfaction of knowing that the arrangement justifies itself by the returns in increased usefulness and happier days.

I should like my partner in the adventure of marriage to possess these qualifications. I think too that she should be free from the cheap cynicism so prevalent today, and from the all too common contempt for the useful regulations and conventions of society. Her instincts and her reactions to life should be wholesome and sound. Her code and philosophy should be clean cut and well grounded.

Inasmuch as I should expect to spend much time in her society, I should want her to be "sporting" in the give and take of life. She would be responsive alike to the fancies of her children and to the visions of her husband.

To those whose privilege it is to know her well this woman would always be—may I say is beautiful?—H.

* * *

"Give and Take"—"Forgive and Forget"

MY ideal wife must be healthy in mind and body; otherwise, she will be unable to carry the mental and physical burdens and troubles which nearly every wife and mother has to bear. A healthy wife who is blessed with good common sense will get over the rough places much more easily than one who is delicate or one who is not well balanced. She will be a balance wheel for her husband and a real helpmeet in good and bad times.

My ideal wife loves human beings, not only her immediate family. She also loves animals. She has a sympathetic heart and is ready to help and comfort wherever necessary. She also has a kindly humor and always looks for the bright and beautiful things in life.

She has a strong religious faith but she is tolerant of other people's beliefs and realizes that we cannot all think alike on religious matters. Her religion is expressed in her daily life.

My ideal wife likes work in the house and the garden and in the chicken house, but she wisely does not allow herself to become a slave to her work. She is a good planner and organizer. She is a good cook and knows what to feed to her family to keep them in health. She takes an interest in her husband's work and in his pleasures and to her children she is not only the loving mother but also their best chum.

She has a sweet temperament and knows that in married life it must be "give and take" and often "forgive and forget." She trusts her husband implicitly, which puts him on his honor, and she does not give way to jealousy. She does not carry gossip and does not meddle in other people's affairs. She keeps herself, her children and her house neat and clean, for no man who cares for the decencies in life can respect and love a slovenly woman.

How We Grow Melons

From Making the Seed Bed to Harvest

THERE are many methods and

By H. J. WALRATH

of the row, and drop the seeds in a

systems in use in melon growing which I will not attempt to discuss here, but will confine my remarks to such methods as have proved successful in our climate and under our conditions.

In the first place we must consider the soil. Cantaloupe can be grown on nearly any kind of soil, but it requires more work to raise them on heavy soil, as it takes more hoeing and cultivating to keep it loose and mellow. We like a sandy loam, because it is easily worked, holds moisture well, is warm, and does not crust over badly after heavy rains. It is well to keep these features in mind in case you have a choice of soils on your farm. Good drainage is essential, as soggy ground will not do. If the land is sour, it will pay you well to use lime liberally. Land sloping gently to the south is desirable. A piece of woods on the north to break off cold winds is a good thing in a northern climate, but the field should not be shaded.

Need Good Soil and Seed Bed

It will not pay to plant melons on ground that is poorly prepared, as you will lose more time in extra cultivating and hoeing. The ground should be plowed fairly deep, as early as it is dry enough, and fitted frequently up to the time of planting, in order to make a fine seed bed of mellow warm soil. This also kills many sprouting weeds and saves much trouble later in the season. It is sometimes a good thing to plow the ground the preceding fall, but if the soil should become badly packed down, as it sometimes does after heavy winter and spring rains, it will pay better to re-plow than to try to raise melons on a field of hard, unyielding soil.

Plenty of Plant Food Essential

Melons require an abundance of plant food, including a reasonable amount of humus. It is possible to oversupply fertilizer, however. This is especially apt to occur if too much nitrogen is used without being well balanced by potash and acid phosphate, which will result in an excessive vine growth, and later maturity of fruit. But as there are so many differences in soils and their needs, it is impossible to give any general rule in this matter. We consider that a piece of ground that is rich enough to raise a good crop of corn is rich enough for cantaloupe. If you have plenty of well-rotted barnyard manure, there is nothing better, provided you add plenty of acid phosphate, which is an element lacking in the manure.

As a general thing, it does not pay to plant melons before you feel reasonable certain that you will have continuous warm weather, as the young plants merely stand still, subject for a longer period to the attacks of insects, etc., and the seed are apt to rot in the ground if a period of cold wet weather sets in before they come up. In our climate, we plant from the 20th of May to the first week in June, which is our corn planting time here; it would probably be safe to go by your local corn planting time.

Hill Method Most Common

One of the most common methods of planting for garden or small field is the manured hill. The hills should be spaced 6 feet apart each way; holes may be dug or furrows plowed, and a small forkful of rotted manure mixed well with the earth and packed down fairly solid. Keep the hill low so that when covered it is little higher than the other ground. Make it long in the direction

straight row, which makes it easier to hoe and cultivate closely.

Eight or ten seeds are better than too many if they are evenly spaced, as the young plants get room to start well, and they can be thinned without loosening the roots of those remaining when they are large enough to be thinned. We thin to about three in a hill after they have got beyond the fourth leaf stage. In covering the seed, be careful to use fresh, fine earth, about $\frac{3}{4}$ to 1 inch deep, firming down gently if a light soil. If a rain should cause a crust to form before the plants break through, it is well to scuff the surface gently with a hoe, being careful not to break off any young plants. This will not only help the sprouts in breaking through, but will kill many young weeds that are about to sprout.

Drilling Calls for Other Methods

In order to plant in drills, some other means of fertilizing is necessary. You may plow under manure, or work fine manure into the soil after plowing by means of a disk. Or you may depend on plowing under a green manure crop such as rye, clover, sweet clover, etc., and add commercial fertilizer after plowing. A light coat of manure in addition to a green crop will help. The fertilizer should be well balanced to meet what you think to be the needs of the soil, and may be drilled in broadcast with a drill, or applied by hand along the rows, or on the marks when marking the ground with a corn-planter, as we often do.

We usually plant most of our acreage on soil prepared as told here, and mark the rows by means of a two horse corn planter. By using the fertilizer in one side only, we can have it applied six feet apart if the planter is set at three feet. We can apply up to 200 pounds per acre in the row in this way, and the same tool can be used later to put more beside the rows if desired, placing it perhaps a foot away from the row, which spreads the root system of the plants better than placing it all in the row.

How We Plant

We have devised a method which takes longer at the time of planting, which time is more than made up by saving in seed, more regular stand, and saving of time in hoeing. After fertilizing and marking as described above, we cross mark at six foot intervals, and smooth off the ground at the cross marks with a hoe, scooping out the earth slightly about the width of the hoe blade, then drop the seeds and cover by hand as described in hill planting. This method is much quicker than the manured hill, and we have had just as good results.

The greatest economy in hoeing and cultivating will be obtained by doing both so frequently as to keep ahead of the weeds; it is much easier to kill most of the weeds with the cultivator while they are in the sprout stage, and much hoeing can be saved by early and frequent cultivation. It also helps the growth of the melon plants by keeping the soil loose and mellow. As the vines get larger, do not hoe or cultivate deeply near the rows, as there are millions of fine roots not far below the surface; in hoeing, draw fine earth from far out between the rows and cover it around the stems of the plants rather than to hack about them with the hoe. Do not hoe or pull big weeds after the vines have set melons, if it in any way disturbs the young melons or loosens the roots, as it does more harm than good.

Saving The Old Apple Tree

The Old Ones Are Often The Best

By David Stone Kelsey

THERE is not so grossly neglected a vegetable servant as the old appletree. Year after year he plods along—sometimes giving bountifully, and next withholding all yield, to recoup the drain of the last crop upon his aging strength, for more and more now-a-days, do enemies, both insects and fungi, infest and pursue his root and branch even unto death.

It may be the very commonness of the fruit that tempts this neglect, starvation and abuse, but since there are now splendid century-old trees still flourishing and fruitful, and some of them with renewed and shapely tops, it will repay any home-loving owner to study his old trees well. They are easily worth fifty dollars apiece if their shade or screening value be considered. As a roof-tree, background or wind-break too, a big appletree might easily inventory at five hundred dollars.

In other words, the appletree has a hardiness, longevity and natural beauty that immensely increase its plodding utility—as a mere producer and a “tree.” And it is upon its hardiness and adaptability, is power to recover from the amputation of heavy prunings and even grafting over into other varieties, that we depend in the operations described below.

There are not fatal blights or rots or cankers that destroy the appletree. Plenty such have lived and fruited for two or three generations after the main trunk was a mere shell, decaying within about as fast as it grew on the outer side.

A forty year old appletree rejuvenated. Note its round, well balanced head, carried well up-hill. It was re-grafted in April 1918 to three desert varieties—Williams, Gravenstein and Spitzenburg, and last summer bore its first full crop. Not one twig of the original top remains. Fourteen grafts of three kinds take its place.

From the single standpoint of the salability of one's property, nothing will pay better than to preserve, and carefully renovate each old fruit tree thereon.

There is not the slightest need to suffer the annoyance of either unsightliness—an appletree whose top is high, sprawling or lop-sided—or of a tree bearing useless fruit accompanied by enemy foliage that cannot be made to glisten with full-fed content. There is not other tree so entirely susceptible to culture, change and severe surgery. The apple is thoroughly, perfectly tamed, amenable to every sort of discipline and the will of man.

The Spy is naturally bushy, upright—plentiful of limbs of approximately uniform size and importance in the tree-head. The Greening has an exactly opposite habit, a sprawling, flat-topped growth that forces

the lower boughs to the very ground. Other kinds are prone to run directly into tall trunks, or will always manage to overgrow one or two of their more ambitious center limbs until beauty of form is lost.

Some appletrees foliate profusely and persistently, their leaves large and glossy-green the season through, others actually seem to neglect this necessary function, their foliage is tardy, imperfect and always rough and scanty. And such are more susceptible to disease and insect pests.

All these variations, however, are but Nature's expression of Her bounty. If one will visit an up-to-date apple-farm, where the culture of this tree is made a constant study, he will be astonished at the uniformly symmetrical shapes, perfect foliage and limb-balance in the trees of every kind. They will “all look alike.”

An un-regenerated tree from the same row—still bearing fairly well, but the tree itself offensive to the eye, all fruit defective, because difficult to reach in spraying and picking besides further limb loss a constant threat.

The expert apple-grower readily makes almost any variety of tree conform to his desires in growth habits and even in bearing. He knows trees, as the stockman knows his chosen breed of animals, and under his touch they thrive and fruitfully abound.

The old appletree should almost never be cut down. There are today, plenty of two-hundred-year-old trees, and those a quarter of that. If the variety is one that is wanted, there only remains the task of rejuvenation. If it must also be re-grafted, that is a longer process—to the double end of both renovation and changing the kind of fruit.

But beware of unskillful management of all this! It is no direct benefit to any tree to hack off a large part of its top, or otherwise to shock it, even by so much as plowing about it thoughtlessly!

If for some years it has been standing in tough sod, every thread of its underground rootlets is now up among the grass. turf roots also—fighting in competition with the grass for nourishment. To plow deeply there is a terrific shock at any time of year. The proper way is to begin with a cutaway harrow, gradually to destroy the sod and so deepen the feeding-ground of the tree's rootlets that it gets notice of the change and can adjust itself.

This should always be done as a first step toward renewing the youth of an old tree, usually in connection with a liberal application of some not too stimulating plant-food. Simultaneously, the re-shaping of the top may begin, though not until spraying thoroughly practiced can follow for the re-awakened tree will need fuller, better lungs (leaves) with which to appropriate the new-found food and newly-directed sap.

And now about that surgery. Where a cut is made to directly encourage renewal branches to take its place (an in “de-horning”) this cut must be made only in spring—or any time after January, when

Dairymen's Page

A Trip to the Home of the Holsteins

CHARLES SCHAFFSMA had often heard his father talk about Holland and the Dutch methods of dairy cattle management. In fact, he had heard it so often that he wanted to see with his own eyes how the people back in the "old country" handled their herds. Two years as herdsman at the New Jersey State College of Agriculture had given him a thorough working knowledge of American methods. His wish to visit Holland began to be realized last June when he left his home in Pennington, N. J., on the start of a trip which was to include stops in France, England and Germany as well as Holland.

It was not until he reached Holland that Schaffsma was able to spend much time in studying dairy cattle management. Here he spent five weeks, living the entire time with the family of Mr. Schapp, in the Province of Friesland. Mr. Schapp is one of Hollands leading Holstein breeders. He and his two sons care for their herd which numbers about 150 head. Schaffsma spent the five weeks in actual work with the herd, so that he speaks from a first hand acquaintanceship.

No Scrub Bulls

"The Holland farmer," says Schaffsma, "never keeps a scrub bull. He is mighty fussy, not only about production, but about type as well. In May the cows are placed on pasture where they stay until the following October. The bulls are not allowed to run with the herd but are staked away from the cows. As soon as the cattle are sent to pasture the barn is given a thorough cleaning and is not used again until the herd is brought in from pasture the next fall. The Hollanders house and barn is practically one building.

"Milking takes place in the pasture. Since early calfhood the cows have been so handled that they give no trouble at milking time. It is interesting to note that the Dutch pastures are "fenced" by small canals or ditches. We in this country would find such a fence a poor means of keeping our cattle where they belong, but in Holland the cattle have long been accustomed to these canal-fences and cause no trouble by jumping them. The Holland farmer takes a great deal of pride in his herd. As a result, the animals are treated with the utmost kindness. It is an unusual sight to see a cow struck with the milking stool or fork handle because she did something not quite in accordance with her milkers wishes.

Do Not Force Production

"The farmer takes personal charge of

feeding the herd. While on pasture the cows are fed no grain. In fact, very little grain is fed at all, for during the winter the only grain they receive is oilmeal cake as a supplement to hay. The Holland farmer does not balance his dairy ration like the American farmer. He does not believe in pushing production. Records are kept only on the best cows in the herd. Two months previous to calving the cows are dried off for a rest. I found that calving trouble is frequent, particularly with heifers with their first calves. Hoof and mouth disease is still a serious problem in Holland. There was hardly a farm in the Province of Friesland that was free from the disease.

Believe in Cooperation

"In the Province there are many cooperative creameries. The land is flat, distances short, and roads are good so that it is possible to deliver milk to the creamery within a short time after milking. Cheese and butter are the creamery products and the farmer brings back the skim milk and whey to feed to the hogs and calves. The Dutch barns are not expensive buildings, but are practical and very warm. As a further emphasis on the matter of cleanliness the cows tails are washed once each week. While the cows are in the barn their tails are tied in such a manner that they cannot fall into the gutter when the animal is lying down.

"Mr. Schapp ships a number of animals to various parts of the world. Last spring he shipped a Holstein bull to Japan. The Holland Farmers have Province associations similar to our county breed associations. Each year these associations ship a number of animals to other countries."

A short while after returning home Schaffsma left for Porto Rico where he spent nearly a month studying dairy cattle management on the Island. His experience there is as interesting as his trip to Holland—but it is another story.

\$2.14 for Every Feed Dollar

RECORDS of the Columbia County Cow Testing Association in Pennsylvania for the year ending October 1924 show that returns of \$2.14 were received for every dollar expended for feed.

Average total cost of feed per cow amounted to \$115.35 and the average value of product totalled \$246.30. According to the records the average cost of feeding the cows was almost equally divided be-

(Continued on opposite page)

State Champion and Fourth in Breed

The record of 15721.6 pounds of milk and 832.17 pounds of butter fat made by Caribou Rosalie 131869, makes her the fourth highest producing Guernsey cow in class D.. She was bred and developed by George C. Stone, Fairydale Farm, Pawling, New York, and she has a former class G record of 11857.6 pounds of milk 628.57 pounds of butter fat.

The consistency of her production is seen in the fact that her monthly milk weights varied only between 1164 and 1402 pounds, and her butter fat, between sixty-two and seventy-eight pounds.

Here is an unusual combination of records in a family group. Rosalie and her two nearest dams have between them ten Advanced Register records, six of them made in immature classes, and all of them averaging 12347.37 pounds of milk and 654.93 pounds of butter fat. Her dam has four records averaging 680.77 pounds of butter fat, while her sire's dam has four records averaging 591.36 pounds of butter fat.

Singleton Farms Herd

(Rhode Island's Greatest Producing Herd of Holsteins)

50 HEAD— To be Dispersed —50 HEAD
April 18, 1925, at the Wallum Lake, R. I. Farm

Including 11 Cows and Heifers that

Hold 21 State Championships

The herd was founded on the blood of a good producing daughter of Colantha Johanna Lad, and through the use of several richly bred sires. The three herd sires will be sold and a few young bulls from large record dams.

Money in Young Stock

HERE'S a chance to make a little pin-money during the summer months, providing you have a little capital on hand and a few acres of pastureland. Jim Blackwell, a well-known farmer, makes money in young stock every year.

Last spring as soon as the weather permitted the stock to go out to grass, he bought up 20 heads of yearlings at a cost of \$15 per head. This totals \$300. He owned ten acres of good pastureland and turned them all out in it. He told me that two head will live well on one acre.

The fences had been repaired before with very little cost to him, except his time. The only expense was salt—and this he fed them every once in a while. They secured their living from the pasture—nothing else was ever given them.

Late in the fall the young stock were drove in and marketed. Blackwell sold them for \$21 per head, thus making a profit of \$120 for the summer. The year before he bought only 15 yearlings but he has increased every year. The market price sometimes varies, but he has always made as high as \$5 on one head.

Seven years ago when Blackwell bought the farm he only had about an acre of pasture that could be utilized without repairing the fences. That spring he bought two yearlings and sold them in the fall at a profit. So as the years went by he repaired fences and increased his buying in young stock every year. He deals mostly in ashire and holstein breeds.

"There is certainly money in young stock if you can raise a little cash to get a start," he told me.—LAURENCE HAYDEN, New York.

LIVE STOCK SALE.

The Sharples 1925 "Quiescent Current" Separator

The Allsteel Separator [600 lbs. per hour]

Sharples Allsteel Cream Separator

Turns easier than any other known separator

Joseph Beckinbaugh, Richmond Furnace, Pa., says his two-year-old boy turns it. That is younger than we recommend, but it indicates the ease of turning. One finger turns it "like a feather." Wife, please take notice!

Gets more cream and more butter than any other known separator

It skims equally clean at widely varying speeds. Other separators may skim clean at a fixed speed, but no other separator does at all speeds. It is humanly impossible to always turn at one speed.

Made of wrought steel—not clumsy cast iron—and wonderful Duralumin, open blade—rust-proof sanitary skimming device

These Allsteel Separators are light and neat looking, but durable and efficient beyond comparison.

A short lecture, but well worth reading

There is a vast difference in cream separators of different makes, and don't think there is not.

The advertising claims of all read alike because language is as free to one person as another.

Neither the words nor the amount of advertising make it better. We are ourselves large advertisers, but that is not what makes our separators better.

A trial side by side with others will tell the tale

Never order any separator on trial unless you order also an Allsteel on trial beside it, so that you may know what should be expected of a separator.

This little Allsteel Separator will look light and small when you get it—so does your watch look small beside a Big Ben, but the watch will last longer and keep better time. But the little Allsteel is a wonder for work and will last a lifetime. We build exactly the same skimming bowl into a heavy cast iron frame and gears. Below is the picture of it. It is an excellent separator. It would please you better than any other kind of separator except the Allsteel.

This heavier, larger separator will skim faster and better and will satisfy you better and will turn easier than any competing separator of like capacity, but not as easily as the Allsteel. Either will last for years.

Take our word for it. We have been selling you separators for over forty years. Our reputation is back of what we say. What we sell you has to please you, has to satisfy you in every way or you return it and get all your money back—if you have paid before trial.

A \$100 Allsteel Separator for \$82

The famous Sharples Allsteel Cream Separator—600 lbs. capacity per hour—is a \$100 Separator and the best Separator for \$100 that anyone ever bought. We have never had a price below \$100 on this separator, and thousands are at work giving supreme satisfaction to their purchasers.

We give thirty days' absolutely free trial, together with an allowance of \$15 for your old separator and twelve months in which to pay by easy installments.

But now we are overstocked with old second-hand separators of every make and cannot dispose of the surplus except for old iron.

For that reason we will, for a time, accept your order for a \$100 Allsteel Separator at \$88—you keeping your old machine if you have one.

Or if you pay cash at end of 30 days' free trial, send but \$82.

Mark X in square on coupon showing plan of purchase you desire, then sign and mail to us.

Heavy-build Separators
Made in Two Sizes

700 lbs. per hour—\$100

Test Your Seed Corn

How to Use the Rag Doll

Ever since last fall I have been reading articles in several farm papers about the serious seed corn situation. About every farm paper we get carries something about it urging farmers to test their seed this year. What is the easiest method for testing the seed here on the farm?—E. E. R., New York.

It is very true that farmers should test their corn this year before planting. Germination tests that have been made on some corn, run as low as 25 to 30%. Last fall seed corn did not mature well. It went into the bins with more than a normal percentage of moisture in the grain. Cold weather came on and this moist corn froze, destroying the seed germ.

About the simplest method for testing seed is what is known as the "rag doll" tester. All this consists of is a corn cob and a piece of muslin about 16 inches wide and about 3 or 4 feet long. From the accompanying sketch you will see how the "doll" is made.

With a pencil or crayon, draw a line down the center of the muslin. Then draw cross lines about every 4 or 5 inches, making a number of oblong sections on the piece. Each section is numbered. Again refer to the sketch.

Have Ear Number Correspond to Section Number

In testing each ear be sure it is numbered the same so as to correspond with the number on the section in which the sample kernels are placed. For instance, suppose you take 10 kernels from an ear and place in section number 8. Take a small piece of paper and a pin. Mark on the paper "8" and pin that to the butt of the ear from which the kernels have been taken. If there are 12 sections you will have 12 ears, each one so marked that it corresponds to the ear from which the kernels were taken. In taking sample kernels, take two near the butt. Turn ear a little and take two more nearer the center. Turn a little more and take two more near the center, and so on until you have ten from different places on the ear.

When each section has 10 kernels, the "doll" is ready to be made up. Note in the sketch that the end section carry no kernels. Turn the edges of the muslin over so they meet at the center line. It is necessary to place the kernels in the section so that they are not disturbed when these edges are turned over. When the edges

have been turned and pressed flat, a corn cob is used as a core to roll up the folded muslin. After the "doll" is fully rolled it is tied with a cord or a rubber band to hold it firm.

When several "dolls" have been made, they are immersed in luke warm water for about four hours. It may go over this a little bit but when you soak it as much as eight or ten hours you do not get the proper results. The dolls are removed from this luke warm water and allowed to drain and then placed where they can be kept warm and moist. During the testing period they should be placed where it is not warmer than 100 degrees or not colder than 50 degrees. The proper temperatures are anywhere from 60 to 90 degrees. It is not necessary to soak the dolls the second time.

They should not dry out however. So in order to keep plenty of moisture available it may pay to wrap them up in a piece of wet sack or stand them up right in an open bucket so that the tips of the cobs stand in just about a quarter of an inch of water in the bottom of the pail. It may be well to cover them with a moist cloth.

After five days, the kernels should be sufficiently sprouted to show their fitness for seed. If the rootlets of any sample are noticeably weak or there are several dead kernels, the ear from which these samples were taken should be discarded. In each section there are 10 kernels and if 4 of the 10 in a section fail to germinate it shows that that particular section tests only 60 per cent and if the remaining kernels are weak, undoubtedly that ear will prove less than 50 per cent.

Testing the corn this way may seem to be a lot of trouble but if a man is going to obtain a successful stand this year he will have to go to some bother if he doesn't wish to take all kinds of chances on replanting his crop a couple of times. Of course, the men who make it a practice to save a two-year's supply can call upon their last year's surplus to a large extent. The man who goes from year to year however, will have to do some testing.

The rag doll testing is not the best test by any means. There are more elaborate and more expensive germinators on the market. However, it serves the purpose well where seed is to be tested at home. If more information is desired relative to this method we would suggest that you write to your College of Agriculture and ask for a bulletin on the rag doll tester or write to the U. S. Department of Agriculture and ask for Farmers Bulletin 948.

The Revolution in Corn Breeding

(Continued from page 331)

favorable season, the expenditure of 35 minutes of man labor, 75 minutes of horse labor, and 35 cents' worth of land, machinery and seed corn. With the improved seed corn which I know can be produced by the method of crossing inbred strains, it will be possible under similar soil and climatic conditions to produce a bushel of corn at an outlay of 28 minutes of man labor, 60 minutes of horse labor and 32 cents' worth of land, machinery and seed corn. With this improved seed corn the average corn belt farmer will be able to produce as much corn as he now produces on 80 or 85 per cent as much land, which means a saving in man labor of over 100 hours a year and a saving in horse labor of more than 200 hours. Of course all of this is assuming that the ravages of the European corn borer do not ultimately offset the gain from a more productive type of corn.

All of the corn belt stations are now in possession of hundreds of inbred strains of corn and will soon be in the process of trying out thousands of combinations to discover just which sorts "nick" best. Within five or ten years they will have good inbred strains for general distribution. The men who will send for these strains at that time will probably be chiefly seedsmen and seed corn cranks. The stations will presumably have to set up a sort of certification bureau so as to prevent unscrupulous people from selling common seed corn under the name of a certain definite cross of inbreds. It will be a difficult matter to work out but the prospect of larger corn yields is so great that a satisfactory scheme is sure to be found.

A revolution in corn breeding is coming which will affect directly or indirectly every man, woman and child in the corn belt within twenty years. Our systems of farm management will be changed somewhat and it is even possible that both domestic policies and the foreign relations of the United States will be somewhat influenced.

Better Cultivation in Field and Orchard

White Diarrhea

Remarkable Experience of Mrs. C. M. Bradshaw in Preventing White Diarrhea

The following letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Bradshaw tell of her experience in her own words:

"Gentlemen: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. I used to lose a great many from this cause, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 437, Waterloo, Iowa, for their Walko White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail.—Mrs. C. M. Bradshaw, Beaconsfield, Iowa."

Cause of White Diarrhea

White Diarrhea is caused by the Bacillus Bacterium Pullorum. This germ is transmitted to the baby chick through the yolk of the newly hatched egg. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that saves nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walko in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnetts Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walko. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shenandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko White Diarrhea Remedy. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send WALKO White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for package of WALKO (or \$1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

WALKER REMEDY CO., Dept. 437
Waterloo, Iowa.

Send me the () 50c regular size (or () \$1 economical large size) package of Walko White Diarrhea Remedy to try at your risk. Send it on your positive guarantee to promptly refund my money if not satisfied in every way. I am enclosing 50c (or \$1.00). (P. O. money order, check or currency acceptable.)

How I Set Up a Brooder Stove

C. S. GREENE

I AM wondering how many of my poultry friends know how to set up a coal-heated colony brooder stove properly and safely with the least amount of labor and expense. No doubt you have all been disgusted and vexed trying all kinds of ways to run the pipe up through the roof or out through the side of the house and after spending a lot of time and hard work on the job you found as I did that you have a very expensive and unsatisfactory arrangement which will only last a year or two. The creosote forms and runs down the pipe sticking the dampers, the fire does not draw or perhaps the soldered connection of the roof collar melts when you start a fire and leaves a leak in your roof. I tried every plan I could think of for over ten years until I adopted the present durability with cheap and easy installation. It is also fireproof.

Installing the Flue

The accompanying drawing shows the construction and arrangement of the pipe. The shanty top is made in the usual manner with a 15 inch collar around the bottom of the pipe set on the same angle as the roof—the pipe running about four feet high above roof. This is set over a hole in the roof a little larger than the pipe and securely nailed under the roofing material above the pipe and over the roofing material below the pipe. The pipe leading from the brooder stove is at least one inch in diameter smaller than the pipe above the roof and extends to the top of this pipe on the inside. A reducer one foot long on the end of the smaller pipe fits the inside of the larger pipe loosely at the top and holds the inside pipe in position. To set up a stove you simply get the right

This shows improved method of brooder house pipe connection with reducer in place at the top.

length of pipe including the reducer, measuring from the stove to the opening in the shanty top and insert it up through the larger pipe. Be careful not to have the reducer too large, only just large enough to work easily on the inside of the larger pipe. I use a 3 inch pipe from the stove and a 4 inch pipe from the roof but if you already have a 4 or 5 inch pipe leading from the stove you could simply make the pipe from the roof one inch or one and a half inches larger although the smaller size is cheaper and answers every purpose. This air space between the two pipes serves as an insulation preventing creosote from running down the pipe and it also greatly improves the draft of the stove. This same principle can be used on houses where there is a brick chimney by simply running the pipe into the chimney and up to the top on the inside and much better results will follow.

A Cost That Saves

The total cost of this pipe and shanty top last year was \$2.50. This inside pipe saves the outside pipe so it will last several years when painted on the outside with a good heat and rust resisting paint. When the cover of the shanty top rusts out

Trapnest Record 192 Eggs Average

"I selected and trap-nested 13 White Leghorn pullets, of pedigree mating, out of my flock raised from 500 day old chicks. Their average was 192 3-13 eggs. The balance of the flock would come up to these records if trapped." (Signed) L. MARTINSON, Palisade, Minn.

NOTE: We have Mr. Martinson's record and sworn statement in our office files.

Won 187 Ribbons \$226 Prize Money

"I want you to know of my success with the 25 White Rock day old chicks bought from you. In the 1923-24 show season, I showed at 33 shows and fairs, winning 3 championships, 43 firsts, 43 seconds, 187 prizes in all, besides \$226 in cash." (Signed) STANLEY GAIDA, Miller Falls, Mass.

Booklet of many testimonials like these on request. Nabob Quality stock is noted for its exceptional laying and winning qualities. Be sure to order Nabob Chicks this year.

RAISE MORE CHICKS

Your money back in 30 days if not satisfied

The Royal, with the largest fire pot of any brooder on the market at our price, holds more fuel and burns either hard or soft coal successfully. The chicks are cozy, happy and growing under a Royal, when the fire would be out in a small stove brooder. The Royal is extra heavy, wirebound and one piece. Five inch flue pipe, and combustion chamber four times as large as other standard stoves. Both check and direct draft are automatically controlled. The grate is large and extra heavy. Fire-pot has straight sides; soft coal will not clog.

Your dealer should have a full line of Royal Poultry supplies. We make brooders, leg bands, chick feeders and waterers, non-freeze fountains and the other supplies needed on the poultry farm. If your dealer can't supply you, send your order direct.

GRANGERS TRIPLE PURPOSE GRIT

WILL MAKE YOUR HENS LAY MORE EGGS

W It is sharp and clean, and absolutely the best substance that can be procured for grinding the chicken's food in the gizzard, and thus aiding digestion, and it is so white that there is no waste, as the chicken finds and gets it all.

NO NEED FOR OYSTER SHELLS

H GRANGERS TRIPLE PURPOSE GRIT is superior as a shell-maker. It produces uniformly hard shells that will not break easily, and does away with any need of oyster-shell, magnesium, or any other such materials fed for shell-making.

Y BALANCES THE RATION—INSURES DIGESTION

GRANGERS TRIPLE PURPOSE GRIT has a definite mineral content of Sulphur, Carbohydrates, etc., which gives the proper balance to the food required by both chicks and adult birds to keep them in good health, and enable the chickens to produce the best eggs and more of them.

Reviewing the Latest Eastern Markets and Prices

MILK PRICES

THE Dairymen's League Cooperative Association announces the following prices that dealers will pay the League during the last half of March for milk testing 3% in the basic zone of 201 to 210 miles of New York City. It is understood of course that the prices mentioned below are not received by the farmer but go into the pool. They are prices dealers pay the League.

The reduction in Class 1 amounts to 27 cents per hundred while in Class 2 the reduction is 10 cents per hundred in each class, A, B, and C. Class 3 prices remain the same as in early March.

It is reported that the Directors have voted that these new prices for the last half of March will be continued in April unless conditions warrant further change.

Class 1 Fluid Milk	\$2.80
Class 2A Fluid Cream	2.10
Class 2B Ice Cream	2.15
Class 2C Soft Cheese	2.05
Class 3A Evaporated whole milk	
Cond. whole milk	1.90
Class 3B Whole milk powder	1.85
Class 3C Hard cheese other than	
American	1.65

Class 4 prices will be based on butter and American cheese quotations on the New York market.

Sheffield Producers

The Sheffield Farms Producers announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$2.80
Class 2	2.10
Class 3	1.65

Class 4 prices determined by butter and cheese quotations on the New York market.

Non Pool Cooperative

The Non-Pooling Dairymen's Cooperative announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$2.80
Class 2	2.20
Class 3A	1.80
Class 3B	1.75

sociation (Philadelphia Price Plan), announce the receiving station prices or the price to the farmer in the 201 to 210-mile zone from Philadelphia for 3% milk is \$2.19. In the 101 to 110 mile-zone, the price is \$2.29.

February Pool Price Announced

The Dairymen's League Cooperative Association announces the following pool prices for February for 3% milk in the 200 to 210-mile zone:

Gross Pool Price	\$2.38
Expenses08

Net Cash Price to Farmers.....\$2.30

No deduction on certificates of indebtedness.

This net cash price of \$2.30 is the highest cash price in the history of the pool. It is 48 cents per hundred higher than the net pool price for February a year ago and is slightly lower than the January price due to the increase in surplus with the advance of the flush period of milk production. According to League officials the present situation of league dairymen is very favorable. The number of cancellations received during the recent withdrawal period were relatively small. The League reports that February 1 and March 19 they accepted 400 new members, applications coming in at the rate of about 30 a day.

BUTTER HOLDS ITS OWN

Although it suffered a slight setback after our last report, nevertheless the butter market recovered this one cent decline and is now holding its own. In these columns last week we said that it was very doubtful that prices would go any higher in view of storage holdings and the fact that too rapid an increase would hold up consumption. This is exactly what happened. As soon as the price hit 50 cents for fanciest grades, small buyers ceased purchasing and the big operators bought only enough to meet current needs with a consequent weakening of the market which brought about a cent reduction. However, on March 16 business was sufficiently active to bring the highest scoring marks back to 50c. We still cannot see how the price can go much above this. Receipts have been heavier than anticipated and some Canadian and New Zealand butter has entered the trade to say nothing of held butter from nearby storage.

On March 17, 93 score butter was selling from 49½ to 50c while 92 score was worth from 48½ to 49c. Lower grades ranging downward to 36c.

CHEESE MAKES SLIGHT GAIN
The cheese market is firm on all description of held goods and the fanciest marks of such advanced a half cent so that now these fancy specials are bringing from 26 to 27c while average run, held whole milk State flats are worth from 25 to 25¼ c. There is not a great deal of fresh State cheese arriving, although the make is increasing slightly. Fresh whole milk State flats are worth from 24 to 24½c, the same as last week. The other grades ranging downward to 21c. Trade is active and the outlook is firm and steady.

EGG MARKET WEAK

The egg market is in a pretty weak condition. There are a number of factors that are operating to keep values of nearbys down. In the first place advices from Chicago and other interior producing sections give indications of heavier shipments. This tends to scare off the buyers and keeps the market in an unsettled condition. Pacific Coast whites are raising hob with nearby shippers. Big buyers are turning their attention more to this line of goods and some sales have been made as high as 41c while 40c represents the top knotch for the fanciest nearbys. It is a fact that there is not a great deal of extremely fancy nearby stock arriving. But nevertheless what is coming in is not getting a whole lot of attention. One encouraging feature of the market is that intermediate grades are getting better attention and values in those lines may improve.

POULTRY EMBARGO LIFTED

On March 13 orders were signed for the lifting of the embargo which has been in effect since December 11. The lifting of the ban however was only

partial, several states still being on the doubtful list pending a final investigation by experts of the U. S. Department of Agriculture. These states include Pennsylvania, New Jersey, Illinois, Ohio and Indiana. Shipments from New Jersey must be accompanied with certificates stating that the poultry is in perfect condition. This will undoubtedly create an easier market. On March 18, prices were not any too firm. Express fowls had to be very fancy to bring 30c, although a few sales were reported at a slight premium. Fancy chickens have been bringing as much as 38c but a lot of the stock has been staggy, some of it having to be sold as roosters. Spring broilers were bringing 55c while winter broilers are 10c lower. Ducks coming from nearby points by express are worth anywhere from 25 to 30c. Rabbits are bringing anywhere from 30 to 35c.

OLD POTATOES DULL

News from the country varies. Advice from western New York indicates a steadier tone there on potatoes. It is said that the holdings are not as heavy as were anticipated and potatoes are selling between 35 and 40c a bushel with 150-pound sacks of U. S. grade No. 1 at \$1.45 F.O.B. Shrinkage in storage is reported to have been heavy.

It is going to pay growers who still have stock on hand to watch other markets than New York City. The Metropolis seems to be the center of all shipments while other cities are being passed up. Several times during the past months Pittsburgh has been a better market. Buyers in the terminals around the greater city, are exceedingly critical in their purchase and car after car is being turned down. It has never been known when there has been so much trouble with rejected cars as the trade is having this year. If a man is shipping at this late date it is going to pay him to scrutinize his potatoes carefully. Any dry rot will be detected in a hurry and buyers are not hesitant at all about criticizing the least imperfections in the most severe manner.

BEAN MARKET QUIET

There is nothing new in the bean market. Trade is quiet to the point of dullness, in fact things seem to be tending easier. Pea beans are selling anywhere from \$6.50 to \$7.00. Very little business is done at the top figure. Marrows are worth anywhere from \$9.75 to \$10.25. Red Kidneys are centering around \$10.50 for the fanciest marks while common stock is selling now at \$10. White Kidneys are bringing anywhere from \$8.50 to \$9.

BETTER TONE ON HAY

Although there has been no change in prices at the moment the hay market has taken on a firmer tone. Receipts have been lighter and there is a real good demand for top grades. Prices are about the same as last week, No. 1 timothy brings \$25, lower grades varying anywhere from \$14 to \$23 for No. 1 depending on size of the bales and while intermediate and lower grades are worth from \$17 to \$21. Second cutting alfalfa is still at \$29 to \$30 for No. 1 and \$23 to \$26 for other grades.

WHEAT MARKET BREAKS: CASH GRAINS AND FEEDS

The wheat market on futures has taken an awful drop. On March 17 the market was 51c under the high point that was reached on January 28 when May wheat sold for \$2.05½. Speculators in this case are taking the loss. The reason for the downward trend has been reports from foreign markets and foreign producing areas which indicate that the world crop will be heavier than in 1924.

Cash Grains

The following prices prevailed on March 17 F.O.B., New York City: WHEAT, No. 2 red, \$1.90 to \$1.91. CORN, No. 2 yellow, \$1.30 to \$1.32; No. 2 white oats, 55 to 56c. Rye, \$1.30 to \$1.31. Buckwheat \$2.30 to \$2.35.

Buffalo Feed Prices

Since Buffalo is an important milling center for wheat feeds and linseed meal, the following quotations are given for this point on both a through-billed and

local basis, as reported by the U. S. Department of Farms and Markets on March 14. Ground oats \$23; spring wheat bran, \$23.50; hard wheat bran, \$28; standard middlings \$26; soft wheat middlings, \$36; flour middlings \$34; red dog flour, \$41; white hominy, \$45; yellow hominy, \$37.75; gluten feed \$47.75; 36% cotton seed meal, \$40; 41% cotton seed meal \$42; 43% cotton seed meal, \$44; 34% old process oil meal, \$39.

Saving the Old Apple Tree

(Continued from page 335)

the wood is not frozen—and before the bark will peel. Contrariwise, where sprouting is not wanted—this limb should be removed in fall—August to December, thus directing the flow of tree-life to other parts.

All grafting is of course done in early spring. If the tree be of fruiting size, this process had best take place in a series of two or three years, beginning with those limbs most central, and not cut lower than where three or four inches in diameter. A two-inch limb should be served with two lively but dormant scions, a three-inch with four, and a four-inch with six or more scions, thus both making sure of a good "catch," and helping to take care of the largest possible amount of sap-flow this first season, even if afterwards "thinned."

Later, a part of these grafts may be removed, though not, as a rule, under three years, and meantime great care must be given that the winds of summer storms do not remove them, as their hold upon the amputated stump is at first precarious. The surrounding, untouched or trimmed back tree limbs will help to protect the new-growing, rampant grafts, and to maintain the needed upright development, but firm stakes to which the shoots can be tied are sometimes also necessary.

One or two years later, the more outer limbs should be graft-worked in the same way, and by the third year, the last, outside ones. In all this choice of scaffold branches—some to be re-grafted, some to shorn permanently away—a "man who knows" should have entire charge of choosing which and which. He can "see" in mental grasp, the new top as it will soon stand, a balanced, shapely and vigorous crown upon the still sound and sturdy tree-stock—good for at least another fifty years of fruitfulness, and let us trust, of more and better fruit.

SWINE BREEDERS

150--Pigs For Sale--150

Chester and Yorkshire cross and Berkshire and Chester cross, all weaned and good blocky pigs, no runts. Pigs 6 to 7 weeks old \$6 each, and 8 to 9 weeks old \$6.50 each. More people are talking about this Fine Car than any other Car in America

Of course people are talking about this new fine Overland with six cylinders. Of course they are drawn into liking and admiring and wanting this remarkable car. For motor car buyers these days are real students of quality, close judges of value—buying shrewdly and keenly after making shrewd and keen comparisons. Q The public was bound to admire the fascinating beauty of the new Overland Six. And bound to ap-

preciate its fine comfort and luxury. Q The power of this car is a joy. You can overtake and pass nine out of ten cars on hills, and likewise on the open road. In traffic the swift getaway of the new Overland Six makes cars around you seem listless and poky. Q Great smoothness is engineered into the engine. The wonderfully balanced crankshaft is ingeniously drilled to receive perfect lubrication at all speeds. And by in-

genious developments in six cylinder design friction and wear have been minimized to the vanishing point. That means great endurance. Q You need but one look at the new Overland Six to know why it is receiving such an enthusiastic welcome. It has beauty and style, comfort and luxury, to a degree never before offered at such a low price . . . Willys-Overland, Inc., Toledo, O. Willys-Overland Sales Co. Ltd., Toronto, Can.

They Have Stopped Mistakes in Painting

—with the help of the Farm Painting Guide

YOU can do the same.

Save the Farm Painting Guide, put it up on your wall in a permanent place, and then, every time you go to buy paint, varnish, stain or enamel, look at the "Guide" first.

The Guide simply makes it easy to select the **RIGHT** type of paint, of varnish, of stain and of enamel exactly as a color card makes it easy to select the right color; *it stops mistakes in painting.*

Be sure to look up
"Paint Headquarters"

The store in your community displaying the "Guide" and carrying the correct Sherwin-Williams finishes is "Paint Headquarters." Look for the "Guide" in the window and inside the store.

The Sherwin-Williams Dep't of Home Decoration will gladly give you individual suggestions for your home if you write them. Ask for free booklet B450 and for free set of handsome color plates. If you want the most complete book on home decorating ever issued, 177 pages, many beautiful full-page decorative schemes in colors, send 50c (65c in Canada). Write The Sherwin-Williams Co., Dep't B435, 610 Canal Road, Cleveland, Ohio.

Armstrong's
Linoleum Rugs

*Wear longer-genuine
cork linoleum clear
through to the
burlap back*

The cost is so little

"Gracious me, am I *too* getting
to be an old-fashioned drudge?

*—am I needlessly missing the leisure, the laughter,
the friendships I STILL have a right to? Surely there
MUST be some easier-to-clean floor covering."*

Armstrong's Linoleum Rugs *are* easier-to-clean.
"2 minutes mopping and—CLEAN!" And they
stay clean longer because an Armstrong Rug is
always solid, genuine cork linoleum, clear through
to the burlap back.

You just *can't* dislodge ground-in soil from a floor
surface that splinters and chips off into pits and
jagged hollows, without going back—hands and
knees—to the old-fashioned, back-breaking scrub-
bing brush. So let's forget that, once and for all,
and get an ARMSTRONG RUG.

ARMSTRONG CORK COMPANY
Linoleum Division
1002 Jackson St., LANCASTER, PA.

*Sitting-room and
Dining-room*

All roads lead to the dining room
and many the scuffling, soil-
stained boots along the way. Three
times a day a rush of feet, big
and little, tracking carelessly over
your floors! What more sensible,
sanitary, and fresh-smelling than
an Armstrong's Linoleum Rug
for this heavy traffic room?
"2 minutes mopping and—CLEAN!"

*Bed-room and
Nursery*

Windows flung wide, day and
night, dust settles thick on up-
stairs floors. How easy to keep
them sanitary and clean by
stroking a damp mop over, an
Armstrong's Linoleum Rug.

Three appetizing JELL-O desserts

YEARS ago it was necessary for the housewife to spend much time and trouble in the preparation of desserts. Pies, puddings and other sweets required many ingredients in the making, as well as long hours spent in the hot kitchen. Then, there was always the uncertainty that the dessert would not be successful.

To-day, this has all been changed. In Jell-O, we have a dessert which is simple and easy to prepare, yet may be served in so many ways that there is always variety. It removes the uncertainty from

dessert making and provides a delicious, healthful sweet at a small cost.

Serve Jell-O often;—give it a prominent place on your household menu. The family will enjoy it and the children usually ask for a second helping.

Three favorite Jell-O recipes are given below—many other delightful suggestions for desserts and salads may be found in the little folder in each Jell-O package or write us for our new Jell-O book. *It's Free.*

ORANGE JELL-O

Dissolve a package of Orange Jell-O in a pint of boiling water and pour into mold. Serve plain or with custard sauce or whipped cream. In the illustration below the molded dessert is garnished with sliced pears and cherries.

CHERRY-LEMON JELL-O

Dissolve a package of Cherry Jell-O in a pint of boiling water and pour into mold. Dissolve a package of Lemon Jell-O in a pint of boiling water and when cool pour into glasses or plain individual molds. Turn the Cherry Jell-O out on a large plate and arrange the individual Lemon molds and dabs of whipped cream topped with a cherry around it, as in illustration above.

STRAWBERRY JELL-O

Dissolve a package of Strawberry Jell-O in a pint of boiling water. Pour into a bowl or mold and set in a cold place to harden. When set, turn out on a plate and serve plain or with whipped cream.

New York Farm News

Western County Notes--By M. C. Burritt

WE are having rather unseasonable weather for early March. For the most part it has been bright and warm, not even freezing at night. This has resulted in lots of surface mud, but three or four inches below the surface the ground is still frozen. In some locations where frost was not so deep mud is even beginning to dry up and the surface to harden as in a real spring. At the present rate of drying and without rain it won't be long until we can plow. So early a spring, however, makes most of us suspicious—it is very unlikely to last and may result in much damage.

Fruit Buds Are Swelling

The fruit buds are swelling under the warm sun. There isn't so much danger in this fact, as in the possibility that the thermometer may drop to zero and below before the winter is finally gone. Buds are all right yet, in fact give promise of a liberal bloom, but after a prolonged warm period it takes much less cold weather to injure the buds than it does when they have been continuously in cold storage all winter.

Last week we unloaded two cars of bulk acid phosphate ordered cooperatively. It came through in fine condition and the two cars showed a total shrinkage of only 555 pounds. When the cars arrived our local cooperative agent notified all who had previously ordered. They came to the warehouse switch with team or truck and provided with old feed or fertilizer bags and scoop shovels. It was a comparatively short job for each man to bag his few tons of acid, weigh in and out and get his load home. In thirty-six hours the cars were empty. A few drew their loads in bulk in wagon boxes and stored in piles on the barn floor saving bagging. We were favored with a bright day consequently with no danger of getting the phosphate wet.

Storing Acid Phosphate A Problem

The matter of storage is important. With the increased use of acid phosphate there have been many complaints of "hard" acid. This may be due either to its being "green"—i.e., only partially cured at the point of manufacture or to its having been stored in a damp place where it absorbed moisture. It being both convenient and human nature to do so the manufacturer usually got the cussing for having shipped the goods too green.

While this undoubtedly occurs, I believe that a more frequent cause of hard acid is poor storage. We stored ours on a dry barn floor setting the bags upright on an improvised platform about eight inches off the floor and in such a manner that the air can circulate about the bags. I would not want to store anywhere but in the driest places.

Saved Farmers Money

As a result of furnishing our own bags and securing a bulk freight rate we calculate that we saved about four dollars a ton on this shipment. At least another dollar was added to this saving because we paid cash at the car door. These four ways of saving in the cost of supplies are worthy of emphasis: (1) shipment in bulk saves packages and (2) takes a lower freight rate (3) cash saves interest and credit costs (4) car-door delivery saves storage and rehandling. There are only two ways in which to offset the lower prices secured by these methods: buy a cheaper quality of goods (this may not be a real saving) or the local dealer must waive his profit in handling.

Pruning About Over: Getting Ready for Field Work

Pruning has been the order of the day in the apple country during the last two weeks. Some growers are practically through. One neighbor even has his brush drawn and piled. Most of us are never through. We do all we can each year and begin next year where we left off this. It

has been a muddy job this week. One at a time we are getting each piece of equipment overhauled, broken parts repaired or replaced and ready for action as soon as needed. Last week it was harnesses. As there is no local harness shop any more we have to go 15 miles to Rochester for repairs—and they are outrageously expensive too.

The apple market is at a standstill. Last week there were very few sales and prices were chiefly on paper. This week prices have been lowered slightly but movement is still slow. The cabbage market has practically gone to pieces with prices at \$10 to \$12 and few buyers at that.—M. C. Burritt.

Long Island Farm Notes

D. T. HENDRICKSON

THE Federal Land Bank of Springfield, Mass., has opened an office in Riverhead, the county seat of Suffolk County. George W. Hildreth, District Attorney of the county, who has been attorney for this bank since 1918, has accepted the position of Secretary-treasurer for Long Island in conjunction with his duties as attorney. The bank has \$1,000,000 to loan to the farmers of the Island at 5½ per cent. interest. Mr. Hildreth says that applications for loans will be given prompt attention, but such applications should be filed some time in advance of actual needs.

The State Institute of Applied Agriculture at Farmingdale is becoming of real service to poultrymen. There has just been installed a new 3,600-egg Newton Giant incubator, of the latest triple deck, unit stove, type. This machine is equipped with every automatic labor-saving device, including electric alarms on the temperature regulators and mechanical egg turners.

C. E. Lee, head poulterer at the Institute, recently took off the first hatch of the season. Out of 500 Rhode Island Red eggs, 418 vigorous chicks were hatched, the percentage of dead germs being but 14.4. This high percentage was due primarily to the rations fed the breeders. The feeding plan for each 100 breeders is as follows: Morning, 5-8 pounds of cabbage, waste lettuce, or other green food; a mixture of 2-4 pounds of semi-solid butter-milk, 4 pounds of soaked (germinated) oats, and ½ pint of Norwegian cod liver oil. The oil is spread on the mash in the troughs. The soaked oats provide the yeast diastase so valuable as an aid to digestion. Noon and night, the regulation mash and scratch feeds are given.

Ontario County—Changeable weather in late February left wheat exposed to the weather. Live stock of all kinds in early March was doing well; farmers have been feeding their animals fodder very heavily. Many auctions are being held, livestock selling well except horses. Some farmers have received \$2 per bushel for wheat. Red kidney beans have been selling at \$9.50 per 100 pounds until recently when the price dropped to \$9. Cabbage, carrots and potatoes are low. Live port is \$11 per 100 pounds; lamb 16 cents per pound; butter 38 cents and eggs lower at 30 cents per dozen.

WOMEN'S WANTS

BARREL LOTS Slightly Damaged Crockery, Hotel Chinaware, Cookware, Glassware, etc. Shipped direct from factory to consumer. Write for particulars. E. SWASEY & CO., Portland, Maine.

WORLD'S FAMOUS MILK and butter caramels made on farm from milk and butter. Greatest process discovered. Thousands satisfied customers. 3 pounds. \$1 postpaid. JOHN LEHMAN, R. D. No. 8, York, Pa.

When writing advertisers

Be sure to say that you saw it

in AMERICAN AGRICULTURIST

How to Set Up a Brooder Stove

(Continued from page 339)

it is simply cut off about 3 feet above the roof and a new one set on over the pipe which can be done in a very few minutes without disturbing the roof connection.

This is the most valuable improvement in brooder house construction work that we have found in many years.

Coal Burning Brooders Beat Hens

I see a lot of brooder advertising. We have always used hens before, we have lost so many chicks we are going to try artificial brooding. Would you advise a coal burner or an oil burner?—J. N. E., New York.

FOR the man who raises any number of chicks at all, it is not good business to depend on hens. They roam around, lose chicks and call for a lot of additional labor. It is a lot more efficient to take care of 150 or 200 chicks under a brooder than taking care of 15 or 20 hens each with a little individual flock.

The comparison between oil burning and coal burning brooders, depends entirely upon the machine you have in question. We have had experience with both. Our experience with the oil burner was rather disastrous. One of the boys who had no experience with the adjustment failed to leave the lamp in the proper condition and about half past ten one night we found the brooder house in flames and most of the chicks burned. That has made us rather cautious with kerosene or gasoline under any circumstances. The coal burning stove is not hard to take care of and is economical in its operation. The good ones are equipped with thermostats that keep the heat well regulated. An advantage in the hover type of brooder lies in the fact that the chicks have access to the heat from all sides and do not have to hunt around for a single door.

We would suggest that you write to the New York State College at Ithaca, N. Y., the New Jersey State College of Agriculture at New Brunswick, N. J., and the Pennsylvania State College of Agriculture at State College, Pa., for bulletins on the artificial brooding of chicks.

Poultry Embargo Lifted: Five States Still Affected

THE embargo on live poultry, which was issued by the New York State Department of Health on December 11th last and by the New York State Department of Farms and Markets on December 12, was practically lifted on March 13th. All states however, do not come under the release which went into effect on the 13th. Ohio, Illinois, Indiana, Pennsylvania and New Jersey are still banned pending a report from the Bureau of Animal Industry in Washington. The Bureau is just about to complete a survey of those states to determine definitely whether the so-called chicken plague has been completely wiped out.

Originally the poultry embargo shut out

poultry produced in 13 of the leading producing states. It is said to have been the most drastic step ever taken by public health authorities. It practically cut in half the supply of live poultry, which is the principle food of the Jewish population in the Metropolitan district.

Good Stock Now Arriving

According to members of the live poultry industry in New York City, live poultry now coming into New York to supply the kosher trade is of a higher average quality than has ever been received before at this season of the year. It has been our contention right along that all this scare about the European pest has been due not so much to disease conditions as to the fact that there has been a lot of weak poultry shipped from the west, too weak to stand the rigors of the long freight travel. By the time the birds reached eastern markets they were ready to die.

Sunlight Essential for Young Chicks: Cod Liver Oil For Leg Weakness.

WE find that direct sunshine is absolutely essential to keep young chickens in a healthy and thriving condition. Many a farmer's wife has met with serious disaster with her early spring brood of chicks because they had to be confined in a basement or some other shaded spot. Direct sunshine contains certain rays of heat which is necessary that does not pass through ordinary window glass in order to prevent leg weakness and other chicken diseases.

When chicks have the full benefit of the sun's rays, (to a large degree) they are safe from disease if properly fed. Cod liver oil and the yolks of eggs will take the place of direct sunshine. Common cod liver oil such as druggists' sell is not the right kind to feed chicks. It is an emulsion. Some stores have put in supplies of the raw oil that should be fed.—W.H.H., Virginia.

Editor's Note: If you do not know where to get cod liver oil of the proper kind, write the A. A. Service Bureau for names of reliable firms.

Treating Common Poultry Diarrhea

I would like to ask through the columns of this paper how to cure a persistent case of diarrhea in poultry. I have a nice Jersey Giant cockerel that has had it for weeks and I cannot check it. It isn't the white diarrhea. It eats good and seems healthy.—L. M. D., New York.

THERE is undoubtedly nothing more or less than a case of common white diarrhea, though the case about which you inquire only may be a mild form of diarrhea, nevertheless, we would treat it with considerable care in view of the fact that it may become dangerous.

We therefore suggest that the first thing to do is to isolate the bird and treat it individually. It may be that the rooster has eaten some improper food and as yet it has not worked out of the crop. It is therefore recommendable to give it a dose of castor oil. A teaspoonful is enough. After you are quite sure the oil has reached the crop, manipulate the crop with the fingers to work it around the contents of the crop. If you do not wish to bother with this, you may substitute some Epsom Salts in the mash.

There is a possibility that the ration you are feeding is not well balanced. You may (Continued on next page)

Raise Chicks to Make Money

1925 promises to be a great year for chickens—layers are scarce, work is plentiful, folks have money to spend and living is going higher. There is always ready sale for fresh eggs and home-dressed fowl, higher than market prices. Cooley's chicks will be laying five months after their arrival. My strains of Leghorns are truly remarkable layers.

Cooley Chicks are the Healthiest, Most Vigorous, Desirable Chicks Hatched. They Always Satisfy.

50,000 customers know these facts.

Write today for
COOLEY'S NEW CHICK BOOK
and chick prices.

It's the most interesting book of the year for those who have room for as few as a dozen laying hens and also contains much helpful information for the oldest and largest poultry keeper.

(Continued from Previous page)

know that many women, especially farm women, do not get a square deal from their husbands.—K.

* * *

He Wants a Farm Girl.

I AM a regular reader of the AMERICAN AGRICULTURIST, and the subject "My Ideal Wife" appeals to me. Being single, my opinion on this subject is based upon observation of the wives of others, and also upon my personal preference.

Girls reared on the farm usually make excellent wives, because of their conservatism, energy, patience and loyalty. By nature, they are contented to accept the conditions of their homes, and will work, save and plan to help their husbands to succeed. My ideal wife is one who is possessed of good health and a good disposition which is usually associated with health, and an abundance of courage and good sense. A wife of this type could properly determine what should be her share of the work in the home and in the dairy. It should not be any more than is reasonable or necessary, and consistent with economic conditions.

As to her being good-looking, beauty like the flowers blooms and fades away; but a good character is always beautiful. On this attribute of women, I shall quote the great Napoleon, who once said: "A beautiful woman pleases the eye. A good woman pleases the heart. One is a gem; the other a treasure."—D.

* * *

Educate a Girl and You Educate a Family.

SHE will be able to say at all times. "The Lord is my shepherd; I shall not want." The Christ will dwell in her heart, and show forth in her life.

She will honor her father and mother, but when she marries, her husband will not be expected to love, honor, comfort and keep her family, but just to be good friends and neighbors.

"Silence is golden" in married life. She will be careful how she praises her father, mother, brothers and sisters, relatives and friends in the presence of her husband.

In her home she will receive advice and suggestions, but will not be driven by either husband or children. She will consider the financial income of her family and plan expenses so at least a bit can be saved.

It has been said that, "educate a boy, and you educate an individual; educate a girl and you educate a family." The ideal wife will obtain the best education possible, including sufficient music that she can at least play the old songs and hymns.

Many will say that her disposition should be governed by love, that the joys of courtship should continue throughout married life. That may be poetical, but not practical. True, she must love, but love is not expected to endure every storm of married life, since Adam fell, as well as Eve.

She need not be beautiful, but she must be healthy in mind and body. Beauty fades early, but the worthy wife remains attractive unto the end.—H.

IDYDELL FARM,

WOLCOTT, NEW YORK

LAWRENCE P. UHL

THE OLDEST AND LARGEST INDIVIDUALLY OWNED AND OPERATED HATCHERY IN OHIO. I am a PIONEER in the Baby Chick business. For 20 odd years I have been producing high class Baby Chicks which have gone out to thousands of Poultry people of America and proven highly satisfactory. For years previous to 1919, (when he retired), I was associated

with M. Uhl, New Washington, Ohio, who was Father and originator of the Baby Chick business in Ohio, making the first shipment of Baby Chicks 25 or more years ago. Since 1919 my output has been entirely taken by dealers who supplied a long line of year after year customers. I have now decided to give the GENERAL PUBLIC an opportunity to buy my high class Chicks direct from the Hatchery here at New Washington and I am in a position to furnish these excellent Chicks in almost any quantity and on short notice at the following prices:

100% Live Delivery Postpaid. Prices on	50	100	500	1000
White, Brown and Buff Leghorns	\$7.00	\$13.00	\$62.00	\$120.00

The Trouble Maker—By E. R. Eastman

The next witness was Dorothy Ball. When her name was called by the district attorney, she took the oath and answered the preliminary questions quietly. But all could see the strain through which she was going by her white face and her interlaced fingers.

She corroborated her father's story on the dumping of the milk on the road and then there was a tense moment when the district attorney asked her if she knew the defendant at the bar. Did she know him! The question seemed to burn itself into her very soul. Jim took one look at her, and then allowed his gaze to drift out of the old courtroom window to the glory of color in the October leaves on the big maple.

"Yes," said Dorothy, quietly. "I know him."

"Was this defendant in the gang that dumped your father's milk?"

It seemed as though everyone in the room had stopped breathing to get that answer. As Jim waited the instant for it to come, he realized how much he longed for her to say the right word. The girl waited so long the lawyer repeated his question.

"I—I—don't know," said Dorothy.

There followed some further questions as to what Dorothy knew about the dumping of the milk and kerosene in Ball's milk house. She corroborated her father's testimony as to what happened in the Ball kitchen after he had brought Jim in.

"That will do," said Hamilton.

Winslow drew himself to his tall height.

"Miss Ball," he said, "you've known this defendant a long time, haven't you?"

"We were children together," she said simply.

"How often did you see him?"

"Almost every day."

"So you feel that you know Mr. Taylor very well?"

"Yes," said the girl.

"In all of this long association, did you ever know of his doing or saying anything that was not in accord with the code of a good citizen and a gentleman?"

The girl looked the lawyer straight in the eye.

"Never!" she said.

"Just one more question, Miss Ball. A woman's intuition often sees the truth more quickly and clearly than a man's reason. Do you really believe James Taylor guilty of the crime as charged?"

Before Dorothy could answer, Hamilton was shouting his objection, which was sustained by the judge.

Winslow told Dorothy that would be all.

The prosecution then rested its case.

The first witness called by Winslow was George Pratt. After being sworn, he stated to the preliminary questions that he was a farmer, lived at Honeyport, that he believed in the fight that the dairymen were waging and had kept his own milk home during the fight.

"Do you know this defendant, James R. Taylor?" Winslow asked him.

"Yes, sir."

"Have you seen him or talked with him since the beginning of the milk strike?"

"Yes, sir, I have talked with him, mostly on the telephone, nearly every day, and told him how League matters were progressing in my neighborhood."

"Was there ever any talk between you about dairymen dumping milk or any other violence?"

"Yes," said Pratt. "In every one of our conversations about the League, Taylor stated that he hoped there would not be any violence. Said it would hurt the Cause and wasn't right anyway."

The tall lawyer smiled at the jury.

"Has James Taylor been in your neighborhood since the strike began?"

"He has," said Pratt.

"Will you tell the jury what happened when he came?"

"Taylor spoke at a neighborhood meeting and told us farmers how the strike was getting along in other sections and urged us to stick together. He advised us to argue with any farmers who kept on delivering their milk, but to be very careful not to touch them or their property."

"Good," said the lawyer. "That will be all."

Hamilton asked a few questions of Pratt in the cross-examination but was unable to make any material change in his original statements.

"We will next ask Mr. Harry Bradley, farm bureau manager of this county, to take the stand."

Bradley came forward and was sworn, and after answering to the usual preliminary questions, he stated that he had

right down the road a little ways along my way settin' up state corn, and she said probably the letter was important, and wouldn't I hand it to Jim as I went along the road."

"Your honor, I object," shouted Hamilton. "What has all this rambling story got to do with this case?"

"Objection sustained," said the judge.

Winslow's courteous, deferential manner left him as he straightened to his full height and brought his long arm down past his head, and finger pointing directly at the judge.

"Judge Rising," he grated, "this testimony is relevant and vital. I can get a re-trial because of that ruling in any court in the land. I ask that you reconsider that ruling and admit this testimony."

The judge glowered at the lawyer for a moment and started to deny his appeal. But as he turned from Winslow for an instant, his gaze was caught and held by Dave Messenger, the sheriff, who had risen from his seat and was

It was an official report of the League strike for the first two days and it was the first letter that Jim had received from headquarters. It was dated Monday, October 2nd, and had been mailed the night before at New York."

"How do you know how it was dated? Are you in the habit of reading the mail of your patrons?" sneered the lawyer.

Winslow objected, but his objection was not sustained by the judge.

"No," said Underwood, answering the question, "but I was interested in the strike and Jim read the letter to me."

"You said a few minutes ago that it was a little after ten when you were at the Taylor place. How can you be so sure of that? Are you a clock-watcher as well as a letter-opener?"

Winslow again objected, and was once more over-ruled.

"I try to keep a certain schedule on my trip so the folks may know when to expect their mail," answered Underwood, "and I remember especially about the time at the Taylor place because my watch had been running a little slow, and I asked Jim what time it was."

Seeing that he was not getting anywhere, Hamilton dismissed the witness. There was a pause of a few minutes while the judge frowned at a man who was whispering excitedly to Winslow. This man was evidently trying to get Winslow to agree to something, but the lawyer was shaking his head. Finally, Winslow turned to Taylor, and the two of them seemed to be trying without avail to convince the other man.

The short patience of the judge became exhausted, and he demanded of Winslow if he was ready to proceed or whether he had closed his case.

Winslow got slowly to his feet, and after a dramatic pause, he said:

"Your honor, and gentlemen of the jury, we have an unexpected witness. The prosecution insisted upon dragging an irrelevant matter into this trial, and has tried to convict this defendant of two crimes, one of which is not charged. The attempted incrimination of Taylor for destroying Ball's milk at his milk house and the dumping of the kerosene should in all fairness have nothing to do with this trial. I cannot believe that you gentlemen of the jury will allow what has been said in this connection to influence your judgment against this defendant. However, we have a witness here who insists that there should be no doubt in the matter and that he be allowed to tell his story which will absolutely clear Taylor of any part in the affair at Mr. Ball's milkhouse. Because of certain circumstances which would reflect upon the witness, we have tried to persuade him that it was not necessary for him to testify; but he has insisted so we will now call Mr. Roscoe Shepherd to the stand."

Shepherd left Winslow's side and took his seat in the witness chair. Many farmers in the room who had drawn milk to his station for years were surprised and shocked at the man's appearance. It seemed that he was twenty years older since they had last seen him. The sneering cock-sure attitude was gone. He was a changed man.

As he answered to the preliminary questions as to his age, his residence, etc., so still was it in the room that his low-voiced answers carried to the farthest corners.

"What is your business?" said Winslow.

"I am superintendent of the local milk plant in this village."

"Does your plant do a big business?"

"Yes," said Shepherd. "Before October 1st, we had over one hundred and fifty patrons."

"And since?" queried the lawyer.

(Continued on opposite page)

What Happened in the Story Last Week

JIM Taylor's trial is in full swing. No legal battle in years has attracted so much attention. The country for miles around is deeply stirred. The court room is packed with curious spectators. This is to be expected in view of the fact that all the principles are local folks. Bill Mead, John Ball's hired man is the first witness called by the District Attorney in his attempt to prove that Jim Taylor is a "trouble-maker" and that he willfully tried to prevent John Ball from delivering his milk at the local plant. The District Attorney has great difficulty in keeping Mead on the right track due to his propensity for exaggerating facts outrageously. This weak spot is brought out clearly by Jim Taylor's lawyer. He shows how ridiculous the testimony is. John Ball is the second witness during whose examination the prosecution is allowed to present irrelevant testimony over, the objection of Jim's lawyer. The unfairness in the judges decision to over-rule Winslow's objection is not missed by the spectators and the feeling prevails that Jim is not getting a fair trial. The third witness, Caroline Hicks, bring some more comedy into the trial by saying she knew Taylor was guilty because she saw a black cat cross Jim's path and since the trial was on Friday the 13th she knew that it meant Jim was guilty.

heard Taylor say time and again over the telephone and in personal interviews, and at every meeting where he had spoken that the dairymen must take great care to avoid any kind of violence. After bringing out a few more answers as to specific places where Taylor had made such statements. Winslow turned him over to Hamilton for cross-examination. Hamilton soon gave up the attempt to shake the county agent's testimony.

Henry K. Underwood was next asked to take the stand. In answer to the usual questions, Underwood stated that his residence was in the village of Speedtown, that his business was an R. F. D. mail carrier, and the route that he served extended northward from Speedtown, into the North Speedtown territory, past the homes of James R. Taylor and John Ball, and then eastward over the hill and down the Honeyport Valley back to Speedtown again.

"About what time usually does your schedule take you by the Taylor home?"

"About ten o'clock usually."

"Were you on your route on the morning of Tuesday, October 3rd?"

"I was."

"Did you deliver any mail to James Taylor or any member of his household on that morning?"

"I did."

"Do you remember what time it was that morning when you reached the Taylor farmstead?"

"Yes. It was about my usual time, about ten o'clock in the morning."

"For whom was your mail?"

"For James Taylor himself."

"Was Taylor at the house?"

There was a tense moment in the courtroom while everybody waited anxiously for the answer.

"No. His sister took the letter and noticed it was from the Dairymen's League. Then she told me Jim was

looking directly at the judge in a strange and incomprehensive manner. The judge's face turned white, he stuttered a moment, and said to Winslow in a voice so low and unnatural that few heard him, to proceed and that the testimony would be admitted.

"Well, Mr. Underwood, did you give the letter to Mr. Taylor?"

"Yes," said the mail carrier. "The road sort of winds around one side of the Taylor farm, and I found Jim out there a ways settin' up corn. I waved the letter at him and he came to the fence and got it."

"Thank you, Mr. Underwood. That will be all."

The effect of Underwood's testimony was easily apparent on the faces of the audience, and the buzz of cheerful whispering and low-toned comment ran over the room.

Before Underwood could leave his chair he was stopped by the harsh, unpleasant voice of the district attorney.

"Just a minute. We're not quite done with you, my man," said Hamilton. You seem quite sure of yourself. Let us see if we can find why. Except for Sundays, you deliver mail every day in the year, don't you?"

"Well," smiled the mail man. "Pretty nearly. I'm supposed to get a few day's vacation, and now and then a holiday, but, mostly they are few and far between."

"One day is a good deal like another, then, isn't it?"

"Yes, same old grind."

Stepping closer to the witness, and striking his fist into his hand to emphasize his question, Hamilton said:

"How then are you sure that you delivered the letter to this defendant on the morning of October 3rd?"

"That's easy," said Underwood. "The letter was postmarked New York, and after Jim looked it over read it to me."

A Poor Rich Man

A Visit with the A. A. Philosophy Man

LAST week I buried a man who had lived to the age of ninety-one years. He was born in Scotland. At ten years of age he came to America. Marrying a pure-minded young woman, they two came to Minnesota as pioneers before the Civil War.

Sixty years passed. This farmer and his wife left a family of nine children, thirty-eight grand-children, and twenty-five great-grand children.

Rev. J. W. Holland A man he was, whom men might call a poor man, yet he really left his family worth more than millions.

He bequeathed them an example of Christian Character. His name never made a banker uneasy. Three generations point to him as a grand-old-man. He felt that if his children could be good, that they

would be great enough. About the dining room table in the little prairie home, this man gathered his children twice a day, and read to them from the Book of God, and then prayed for them.

The corn was never too weedy, nor the hay too ripe but that there was time for prayer.

Is that just a little bit old-fashioned? Well, it is the only kind of living that will save children, a nation, or a world:

He bequeathed them bodies filled with good-blood.

Ella Wheeler Wilcox wrote about the glory of a man who handed to his offspring the heritage of health.

Not long ago a multi-millionaire died, and his fortune was left in entail so that each child might have a certain income throughout life. The principal was never to be theirs. There was not a healthy one in the group, and they spend their time trying to live at resorts by Winter and Summer.

Among the few little things left by this farmer to his children is a Bible. In fact it is the real and sole bequest of a material kind.

Yet, what more can a man leave to his children than safe guidance? No gold half so precious.

In the Book which he left them is this line, "Seek ye first the Kingdom of God and His righteousness, and all these other

American Agriculturist Crossword Puzzle

- 72 To make a certain kind of lace
- 73 Adjust

things shall be added unto you." Another place you will find this, "He that dwelleth in the secret place of the Most High shall abide under the shadow of the Almighty." In another place you can read, "Train up a child in the way he should go, and when he is old he will not depart from it." Among the company of his descendents there were tears, but through their sorrow there shone a light and gladness that so good a father, though poor in purse, had left them his rich heirs in CHARACTER.

The Trouble Maker

(Continued from Page 350)

"Three," said the milk man.

The crowd started to laugh, but before the judge could pound his gavel, Winslow raised his hand and it was quiet.

PENNY A POUND PROFIT

Address Dept. 22 400 Broome St., New York

"Is Mr. John Ball among these three patrons still drawing?"

"He is."

"Do you know the defendant in this case, James R. Taylor?"

"I do."

"Have the relations between you and this defendant been pleasant?"

The man smiled wanly.

"I am sorry to say, they have not," he said.

"Why do you say that you are sorry? Are you not opposed to this milk strike and therefore to Taylor, who is one of the leaders?"

"Yes. So much opposed that I have done Taylor a great wrong—so great, that I am unable longer to live with myself; cannot sleep nights, have no peace of mind, and I am here today to do what I can to square things."

Of all the excited men and women in that room at that moment, no one felt the situation as keenly as Dorothy Ball. Never in all her life would she forget the breathless suspense as she waited for Shepherd's story.

Solution of Last Week's Puzzle

Our Annual GIFT of Roses

Your Sunset Collection is Now Ready

Beauties of the Garden

Our Wonderful Gift to Flower Lovers

Each set contains 15 strong, hardy, one-year-old Rose bushes, averaging from 8 to 12 inches high.

The
Cream
of
All Roses

Five Different
Varieties

Glorious Colors

4 **BEST RED—W. C. GAUNT** (Alex. Dickson)—Of medium size, with pointed buds, with naturally reflexed guard petals of brilliant velvety vermillion, tipped scarlet. Stems rigid, habit branching, large oval beehgreen foliage. Rich tea fragrance; very rich in color.

4 **BEST PINK—MARJORIE BULKLEY** (H. T.)—Of strong, free branching growth; buds long and rounded, opening into buff, heavily flushed with rose, and finishing into silvery-pink; of ideal habit, opening freely in all kinds of weather. Grand garden Rose. Awarded Gold Medal.

1 **PINK CLIMBING—ROSARIE, or PINK THOUSAND BEAUTIES**—This is a bright pink form of that famous Rose, "Thousand Beauties." A grand Rose from any standpoint. We want all of our floral friends to have this Rose. Wonderful in every respect and sure to please.

4 **BEST WHITE—EDEL** (H. T.)—Type, Florence Forrester; bud very large; flower very large, double, well built, stately; opens well in all weather; sweet fragrance. Color white, with faintest ivory shading toward the base, passing to pure white. Foliage bold and distinct. Very vigorous grower; free bloomer.

2 **BEST YELLOW—LADY PLYMOUTH** (Alex. Dickson)—A most distinct and meritorious Rose of the "Souvenir de Pierre Notting" type whose delicate pearly but deep ivory-cream petals are very faintly flushed, giving it a most piquant finish that is difficult to describe. It is delicately pure tea perfumed. Awarded gold medal, N. R. S., and silver medal, Crystal Palace, London.

Should we find it necessary to change any variety, we guarantee that a Rose of the same color and equal value will be sent.

One-Piece "Dutch" Rompers

School of Home Economics Becomes a College

ROMPERS as a garment for all but the most formal occasions are pretty generally accepted by the young mothers of today for their kiddies. They are deservedly popular for they are handy, comfortable, easily changed, and keep a child neat in appearance. Most mothers have a decided preference for the "Dutch" rompers for they enhance the quaint sweetness of any tot with their flaring lines. For this reason a "one-piece" Dutch romper should prove especially popular for it combines ease of construction with all the good qualities of the other styles.

To cup a paper pattern for such a garment, start with a piece of paper twenty-three inches square. Measure down five inches from top of paper at one side; cut in at side for three and one-half inches, curving cut so that it is six inches from top when three and one-half inches from outer edge. Keep cutting, but back toward outer edge and rounding, or curving gradually downward until you reach outer edge, at a point eight inches from bottom when you curve in again, slightly and cut, (still curving) to lower edge. This completes one side. Make other side just the same way, by measuring or using first side as pattern by folding paper down center.

The sleeves may be given better shape by sloping from underarm seams to top of sleeve (see cut) about one-quarter inch at bottom. Now at lower edge measure over six inches from each side; at exact center measure up two inches and cut out the half

elaborate, or not at all. I made two cunning ones of leather tan suiting and merely bound necks, sleeves and pockets with old-rose bias tape and the effect was charming.

Pockets may be cut in any desired shape, tiny chickens or ducks, flower pots, Mother Goose figures, etc. These rompers are suitable for children up to three or even four years of age. The mother who objects to the more boyish styles of rompers for her small daughter can use this style which has all the requirements of either dress or rompers.

For babies just learning to creep, these little suits in some colored goods will keep neater and save much washing. I feel very certain that any mother "trying out" this style will find it a true benefit to her, for it saves work, is extremely easy to make up, uses very little cloth, is easily ironed, comfortable for a child to wear; in short, it is an ideal garment, and one certain to be admired. MABELLE ROBERT

Gentlemen, the Ladies!

IN these days of increasing consciousness of the woman's part in the world's business, it is a fitting tribute that the School of Home Economics at the State College of Agriculture at Cornell University has been made a College of Home Economics by act of the State Legislature and Governor Smith's signature to the bill.

Now it can be truly said that in New York State the educating of the young women has received official recognition equal to that granted to the young men.

Dressing Up The Slaw

FOR a company dinner or for a social occasion at church or grange or an occasional community spread plain slaw can be improved in looks, and in taste to some, by adding a few simple frills. For the foundation the usual mixture of salt, sugar, vinegar and cream can be used, or a thin mayonnaise, or any well-liked dressing. Cut the cabbage as finely as possible and just before it is to be used, as the crisp slaw is ever so much attractive than wilted, coarse cabbage.

Take fresh or canned pimentos and cut them into strips and mix lightly with the slaw. Some like it best to put the red pimento on the top of the individual dishes. English walnuts broken fine, or black walnuts in small pieces can be sprinkled over the slaw or mixed in. A small spoonful of cranberry jelly is nice nestling in the green and white shreds of cabbage.

Celery Adds to The Looks

A tablespoonful of minced celery heart and fresh yellow leaves will give a fine flavor to the relish. One tablespoon to a quart is a good proportion. Some cooks like celery seed better, but this is open to the objection that it does not look so well as the minced celery. Always use white pepper on slaw. A very little sweet cucumber pickle minced fine and mixed in is pleasing, particularly if the pickle is a rich deep green. A tablespoon of fresh sharp horseradish gives a tang to the cabbage well liked by many.

For a special occasion, leave out the cream in the dressing and simply use vinegar, white pepper, sugar and salt mixing well. As the dishes go to the table top them with whipped cream. Some housekeepers call this cabbage fluff and it does look nice. The cream can be decorated with shreds of pimento or sprinkled with nuts if liked.

School Lunch Recipes and Easter Frocks

Films Approved by National Committee for Better Films

THE NORTH OF 36—Just after the Civil War the great problem for the Texas cattleman was to get their cattle to market. This picture depicts the thrilling adventures of a venturesome cowgirl who owns a vast herd, the first to be driven north to Abilene, Kan., to the railroad. Impressive stampedes, Indian attacks and the attempts of land script thieves provide unusual interest. From novel by Emerson Hough, author of "The Covered Wagon" (Paramount)

PETER PAN—Barrie's fantasy about the boy who never grew up and the children who flew away with him to the Never, Never Land, exquisitely done on the screen. Tinker Bell is just what a fairy must be, and Nana, the dog nurse shares acting honors with Betty Bronson as Peter Pan and Ernest Torrence as the villainous pirate, Captain Hook. Enjoyment for all ages. (Paramount)

SO BIG—In this film translation of Edna Ferber's novel, Colleen Moore gives a remarkable performance in the role of the mother whose boy turns out unworthy of her. There is considerable "atmosphere" in the depiction of Chicago of 1887 and Selina's life among the Dutch farmers outside the city. (First National)

Suggestions For the School Lunch

Sandwiches, Cookies, and Dainties That Please and Nourish the Child

WHY not prepare the children's school lunches the afternoon or evening of the day before they are needed? It avoids a rush in the morning when mother is usually busy anyway. Carefully wrapped and placed in the bread box lunches lose neither their quality nor attractiveness. Wrap each sandwich, piece of cake, etc., in oiled paper and place in final container so that it requires no further attention in the morning. We take pleasure in adding little touches to a child's lunch that take time we cannot spare early in the day.

I plan to have a sandwich of meat, egg, peanut butter, or cheese foundation, a "sweet" sandwich; cake or cookies; and a piece of fruit for each daily lunch. Never add anything greasy, sticky, or messy. Milk or cocoa add materially if they can be had. A thermos bottle or cream bottle can be used to carry these. Slice bread for sandwiches thin, spread lightly with butter or substitute, add filling and cut into oblong or triangular shapes.

Some sandwich suggestions:

Chicken or Meat Filling

A hard boiled egg chopped fine, twice that amount of chopped, cooked chicken or meat, a dash of prepared mustard, a seasoning of sweet vinegar, salt and pepper makes a very good filling. Mayonnaise may be used instead of mustard, and vinegar.

Peanut Sandwiches

Chopped peanuts mixed to the proper consistency with mayonnaise spread on lettuce leaves between buttered graham bread are healthful, nourishing, and palatable.

Raisin and Nut Sandwiches

Thin slices of bread nicely buttered between which a layer of raisins and nut meats has been spread, or even just raisins, makes a sandwich most children enjoy.

Iced Cookies

Plain little cookies iced add another attractive feature to the school lunch. To a tablespoonful of cream add enough pulverized sugar to make of right consistency for spreading. Add a few drops of vanilla. Spread on top of cookies or use as filling between two cookies. For variety add cocoa to make a chocolate icing. Nuts, cocoanut, raisins, or dates added to the white icing make a further variety.

Fruit Cookies

To 2 eggs well beaten, add 2 cups of sugar, ¼ teaspoonful of salt, 1 cup melted shortening, 1½ cups raisins, ½ cup candied orange peeling, 1 cup jam or preserves, ½ cup milk, 1 teaspoon each of cinnamon, nutmeg, and allspice, ½ teaspoonful of cloves, 4 cups of flour with which 3 teaspoonfuls of baking powder has been sifted. If required add more flour until the dough can be rolled thin. Cut with cookie cutter, bake in greased pans in

moderate oven. If kept in a tight jar or in tin box these keep moist indefinitely.

Fruit Pastry Roll

A nice pastry roll is made by rolling left over pie dough into a thin sheet. Spread with butter, sprinkle with sugar, stew thickly with raisins, roll as jelly roll, and bake. Thick jam may be added as filling. Cut into rounds when cold.

Stuffed dates or prunes add a healthful bit to the school lunch. Wash, stone, press nutmeats into cavity, roll in sugar. Let dry thoroughly.

Chocolate Crackers

A small piece of sweet chocolate or small square soda crackers, dipped into sweet chocolate are nourishing and pleasing. For

Some women always make tapioca pudding, when one of bread or rice would make a welcome change. They bake a certain kind of cake or one of possibly two or three kinds, potatoes are boiled or baked, vegetables are served the same way month after month, and often only two or three of the fifteen or twenty different kinds find their way to the table.

When a new magazine is received, turn to the pages giving recipes and resolve that you will try at least one of them every day. A magazine can not serve you unless you let it, but with your aid it will make possible the slogan—A new dish every meal.—L. M. T.

Easter Frocks for Coming Spring Days

We suggest dandelion yellow crepe with tiny lace ruffling for the high school dance. No beau could resist the result!

No. 2378 presents the sleeveless slip-on for warmer days. Cut in sizes 2, 4, 6 and 8 years, and suitable for gingham, kindergarten cloth or wearproof percale. Size 4 takes 1½ yards of 36 inch material, with 1¼ yards binding. Pattern, 12c.

No. 2364 shows the right street frock for the girl or young woman. Gaily checked silk adds a dashing trimming touch to a conservative material. Sizes 16 years, 36, 38, 40 and 42 inches bust measure. Pattern, 12c.

Powder blue or Robin Hood green bengaline are ideal for the not-too-dressed-up afternoon frock.

No. 1287 may be used for an every day frock or a more dressy one. A bloomer pattern is included. Sizes 2, 4, 6 and 8. Size 4 takes 2¼ yards of 36 inch material. Pattern, 12c.

TO ORDER: Write name, address, pattern numbers and sizes very clearly, enclose correct remittance in stamps (adding 10c if you want the smart new fashion catalogue) and mail to Pattern Department, AMERICAN AGRICULTURIST, 461 4th Ave., New York City.

dipping crackers melt sweet chocolate over hot water, dip cracker, lay on oiled paper to dry.—Mrs. R. C. KRAMER.

Habits of Cooking

THE smoker who tried to stop realized for the first time how firm a hold the habit was upon him. The tea or coffee drinker has much the same experience, and only when she tries the plan of having at least one new dish every meal does the housekeeper discover how firmly the habit of serving the same foods day after day is entrenched in her kitchen.

This Is the Time To:—

USE plenty of apples, cranberries and tomatoes.
Buy and use more whole wheat flour.
Serve soups.
Use our canned greens.
Plan the children's clothes for next summer and make over old clothes.
Spend a portion of our time reading good literature.
Visit that old friend.
Substitute eggs for a portion of our meat.—Mrs. George Gray.

Extra help! Extra cleanliness! Extra saving in washing clothes with Fels-Naptha Soap! Naptha—the great dirt-loosener—is the "extra" that works with the splendid soap, to make clothes safely clean!

Your dealer has Fels-Naptha—or will get it for you

Service Department

Cortland Farmers Alone Lost \$75,000.

THE people of my home county, Cortland, have lost \$75,000 in the past 18 months in get-rich-quick investments, the Grange of that county was informed at its last meeting, by the Secretary of the Chamber of Commerce. The latter organization for a year and a half has maintained a Burns Detective Agency to protect the people from rascally salesmen. Representatives of the Agency have lived in the county without their identity being known to the public, that they might circulate among the people and thus render better service. Dr. Charles H. Jones, Secretary, has in that time, listed over 800 fake investment schemes in his office, and has been able to get information on practically all others within 12 to 24 hours, when asked for advice.

Lifetime Savings Lost

But there hinges the main difficulty. Although the business men have advertised this service in the papers and posted notices in every bank, yet this huge sum of money has been filched from the county because some people do not read the papers, are not familiar with banks and do not keep up live connections with their farm organizations. Any banker could have advised against these wild cat schemes. But they were not consulted. No one but the wily tongues of the salesmen gave counsel and the savings of life times have been lost, and too many farmers face old age stripped of their provisions against the future. This has meant stark tragedy in many a home; more homes than Dr. Jones or the Chamber of Commerce is aware of. For it is instinctive with people who have made so huge a blunder to cover it up and conceal it from the home town folks.

A Huge Evil

This is an evil that is assuming huge proportions, in these money mad times and it is having a big bearing on business and agricultural conditions. For such investments are genuine losses to the business of the region. How can we reach for their own good, the honest, industrious, but too trusting and inexperienced men who fail to see the flaw in the alluring patter of the skilled salesmen? If these propositions which are as varied as can be imagined, always ringing unexpected and ever new changes, were going concerns or assured of success the financiers nearer the seat of operations, even the employees and all parties concerned would snap up all real bonanzas of this sort, and it would not be necessary to send out salesmen into the highways and byways of the country to seek investors.

Better to Be "Safe Than Sorry"

On November 15, 1924, the New York Stock Exchange offered a free service to the public similar to the service of the Cortland business men have provided for their section. A letter to the Secretary, Committee on Quotations and Commissions, New York Stock Exchange, will bring reliable information as to attempted frauds or proposed securities to anyone in doubt. It is better to be "safe than sorry" and surely any honest salesman will not object to waiting a few days while his proposition is passed upon by this Exchange, if one does not care to consult a local banker or experienced business man. Already the Stock Exchange has given cooperation in hundreds of cases where investigations were needed. Law enforcing officials, Better Business Bureaus, Securities Commissions and Chambers of Commerce have also cooperated with the Stock Exchange for the protection of the people.

Use the A. A. Service Bureau

Our own AMERICAN AGRICULTURIST has carried on a big service to its readers right along these lines. The big difficulty is to get the people to investigate first, before investing. One Cortland farmer just lately lost \$2,187 in this way, investing \$2,000 with the salesman, who had the

audacity, on seeing how easy a mark he had, to ask for \$187 extra for "transferring the securities" in Binghamton. Of course, neither he nor the money has been heard of since.

In a talk at Farmers' Week, Prof. F. A. Pearson advised on investment matters. The time to invest, he said, is when securities are cheap. When they are high it is better to put the money in a saving's bank, for a few months later the same number of dollars may be drawn out as were put in. Securities will probably drop in value in that time if purchased when high.

Keep Away from Common Stock

In general he advised farmers not to invest in common stock in industrial corporations. They are not in a position to study business conditions. The farmer is specializing in making money on the farm. He should leave the stock market alone, for he is a poor speculator. If he does buy stock he should buy preferred stock, according to Prof. Pearson.

Safety of Principal should always come first. The pure investor should never look for appreciation of the stock, but for dividend and interest returns. Liberty or Federal Bonds and farm mortgages are best for the farmer. The farmer should not finance oil wells, or wild cat ventures. He had better finance agriculture, said Prof. Pearson.

Life insurance is good for those who find companies or in public utilities is usually it hard to save. Common stock in railroad held to be good investments.

—MABEL G. FEINT.

Sharps Visit Tioga County

Excitement was at the white heat at Nichols when the news of the work of confidence men, sharps and swindlers became known to the public. Between \$60,000 and \$70,000 were taken from two prominent Nichols men, one of whom was cashier of the Nichols bank. But the bank is solvent, while one of the men is broken physically and financially having given all he possessed to liquidate his obligation to the bank.—MRS. DANA BURCHARD.

A Successful Adjustment

Your favor of February 13th is received, together with check for \$42.50 in adjustment of our controversy.

We want to express our very grateful appreciation to you for the services you have rendered in this connection. We were near the end of our resources in trying to collect it, until we ran across the article referring to the service you rendered your readers, and it appealed to us at once as being one way by which pressure could be brought to bear on them, which has culminated so successfully.

Cover All Your Roofs
DON'T PAY
Until 4 Months' Weather
Proves All Our Claims

YES! Old leaky roofs made water tight with SEAL-TITE at a fraction of the cost of a new roof. One application will add 10 years to the life of your roof.

SEAL-TITE is not a paint—not a roll roofing. It is applied right on top of old roof material, making a flexible water proof veneer that we can safely guarantee for ten years. SEAL-TITE has been proved by many years' use on the roofs of hundreds of big industrial plants, and thousands of stores and homes, the country over.

Don't waste your time and money patching one leak today—a new leak next week—a third leak the week after. Don't submit to ruined crops and rusted machinery, and all the losses that come from a leaky roof. Get SEAL-TITE right now. Apply it any time when the temperature is above freezing. It requires no heating or thinning. Use it just as it comes from the barrel. Just spread it on with a roofing brush—that's all. It penetrates every nook and crevice. Then it dries and cures, forming a tough, flexible, smooth one-piece covering that will not crack or check, or run, and that is guaranteed to withstand the most severe weather conditions for 10 years.

Direct From Manufacturer to You!

You do the job yourself in a few hours. You pay only the rock bottom manufacturer's price for the *original* Liquid Asbestos Roofing, instead of paying up to \$2.00

a gallon asked by itinerant salesmen for inferior imitations of SEAL-TITE. SEAL-TITE comes in steel barrels and half barrels, and one gallon covers about: 50 sq. ft. of composition roofing, 100 sq. ft. of metal roofing and 25 to 35 sq. ft. of tar and gravel.

Instead of offering a small trial package, we offer you enough to cover your entire roof, on a positive guarantee that SEAL-TITE will do all that we claim for it. Order plenty. The cost is but a fraction of the cost of a new roof. And our unprecedented terms of shipment give you positive assurance that SEAL-TITE will do all we claim for it.

No Money Asked

Just mail the coupon below. Send no money. Specify enough SEAL-TITE to cover your entire roof. Put it all on. Wait four (4) months. Then decide if SEAL-TITE has made good all we said for it. If not, you do not owe us one cent. We put it all up to you. Could you yourself, write an offer that would give you greater protection?

FREE Tools

No need of an experienced roofing man to apply SEAL-TITE. Do the work yourself, or hire common labor. All tools needed for the job are supplied you without extra charge. A roofer's brush for spreading SEAL-TITE, a 25-lb. pail of patching cement and a trowel for applying it to leaks around chimneys, flashings, valleys and gutters. All free with your order of SEAL-TITE.

Send Trial Coupon Today!

Don't wait for the next rain-storm to remind you that your roof leaks. Make it watertight NOW. Send the trial coupon by return mail, stating the amount of Seal-Tite you need for your roof, and we will ship it at once from our nearest factory shipping point. That insures quick delivery. You simply pay the small freight charge and deduct it when you pay for the Seal-Tite. Remember—four months in which to prove everything we claim before you pay—and back of that a TEN-YEAR GUARANTEE. Act at once and get FREE a roofing brush and 25 lbs. of plastic cement, and a trowel for applying it. Mail the coupon TODAY.

No Service to Compare with Ward's

"We have been dealing with you for more than ten years and our dealings have always been satisfactory and pleasant. Nowhere can we get such an ironclad guarantee, or such bargains—all first class merchandise. I have been wearing a pair of your guaranteed work shoes for eleven months and they are still good."

"There is no service—mail or home—to compare with Ward's."
Herman J. Dieckman,
Sample, Ky.

Best Mail Order House

"I have been ordering goods from Montgomery Ward & Co. for twenty years, and I have found it the best mail order house in the United States."

"Recently I ordered a suit of Stillson Worsted for \$17.85 and found the cloth much better than in a suit I would have paid \$35 for here."

"I am using a Riverside Cord tire that is the best tire money can buy."

Ira Nelson,
Hamilton, Ala.

Five Dollars goes far at Ward's

"My last order was a dress, a pair of shoes and a flashlight, and I still had 81c left out of my \$5."

"About twenty-five years ago Charlie Miller of Rockport, bought a shot gun of you for \$5. It has had constant use, winter and summer, and no special care, and it shoots today as good as any automatic made. It was low in price and high in quality as all Ward's merchandise is."

Harry Standley,
Newton, Ia.

Quick Service on Every Order

"I wish to express my appreciation of the service rendered on my recent order. It was mailed the afternoon of February 13 and received on February 15, so I had to wait only three days for my order. It was a small order too, proving that small orders are given just as much consideration as the large ones. I saved \$3.50 to \$4 on the electric iron alone by ordering from you."

A. M. Johnson,
Gilmore City, Ia.

Ward's 24 Hour Service Pleases

"I want to thank you for your promptness in sending my incubator. I live six miles from town and three days after I sent my order my incubator was at my door."

"My mother has bought goods from Ward's ever since I can remember, and she, like myself, was always satisfied. When you send an order to Ward's you get exactly what you have ordered."

Mrs. Henry Treece,
Houstonia, Mo.

A Successful Cooperative

How Erie County Vegetable Growers Market Their Products

By R. F. FRICKE

"**N**OTHING succeeds nearly as well as success." Business flocks to the successful business man and to the successful cooperative. There are plenty to fill the band wagon of a successful cooperative and to give it that one prime requisite of a successful business—sufficient volume of business voluntarily contributed. After its success is once established, iron bound contracts, for the time being at least, are unessential. The one main essential that it must have year after year is efficient management and the path is relatively easy and free from pitfalls.

One of the most successful cooperative associations in New York State is the Erie County Growers' & Shippers' Association, Inc. While it is a stock company, it is a co-operative. The vote is by shares, but there is a limit of ten shares that one person may hold and any transfer of shares must be approved by the directors. The stock merely earns interest at 6%. The profits must be returned pro rata to the shippers. Profits have been left in the treasury of the association. That and the capital stock have been used for a site, buildings and working capital.

The property consists of $3\frac{1}{4}$ acres of land on the main line of the B. R. & P. R. R.; office building, 26 x 34; two packing houses, one 30 x 120 and one 36 x 60; one warehouse for storing packages, 48 x 120; one warehouse 30 x 210, and another warehouse 30 x 120 is under construction; icing platform 550 feet long with a daily storage capacity of 100 tons of ice; icing siding 10 car capacity. Additional siding, capacity of 15 cars. The lower part of the icing platform has a basket conveyor and the baskets are automatically conveyed from the packing house to any of the cars on the loading track.

The stock sold for \$5.00 a share. In 1910, a premium of \$15.00 was placed on the stock, but subsequent arrangement of giving trial memberships by a payment of \$5.00 a year till the stock is paid for makes it easy for anyone to ship through the association. The Association ships vegetables, the main crops being cauliflower, market peas, cucumbers and pickles. Each member is expected to sign a contract, giving the acreage of each crop to be shipped.

The members have the privilege of selling any part of their crop to the Buffalo market, to hucksters or to anyone else, except a shipper. Very little trouble of violations are experienced because the association is able to net them more and the members know it. Besides, being in the center of the producing region, it is more convenient for them to go to the association. There is a competing shipper right nearby, but a little competition is a good thing. The Association will be more alert for it.

One reason for the success of the association is the result of grading. Every package that

goes through the association is inspected and a grade marked on each bushel. The peas are brought in bags, dumped and put into baskets and the grade marked on each bushel. The cauliflower and cucumbers are packed by the owner, but inspected and the grade marked on the package. If the pack is not satisfactory, the grower has to repack it. The price for each grade is pooled. In the case of peas, all peas shipped the same day are pooled according to grades. In the case of cauliflower, the price is based on a 3-day pool, also according to grades. Seed and packages are bought by the

Here is a motor truck load of Erie County cauliflower being packed in one of the refrigerator cars under the direction of the Vegetable Growers' Cooperative. The association also does carlot business in market peas, cucumbers and pickles. Its equipment and management is such that it enables the association to do its own icing.

association. A charge of 6 cents per package shipped is made to run the Association. Inasmuch as all the goods cannot be sold f.o.b. they are practically all shipped on consignment. A special commission rate is given the association and the manager is in touch with all the markets in the eastern United States by wire and telephone daily throughout the shipping season. The icing of the cars is done by the association itself.

For the past three years, in cooperation with the Erie County Farm Bureau, extensive seed strain tests on cauliflower were conducted. The Association seed, which they import direct, has been among the leading strains. A big saving is made in the purchase of seed, packages and supplies.

During the past year, 309,000 packages were shipped. This is about 50,000 more than the year before. They were shipped in 675 cars, the loadings being exceptionally heavy due to cool weather and good icing facilities.

Things have not always been as rosy as they

are now. The early years were an uphill fight. The association was the result of a real felt necessity. The pea growers who sold their surplus peas to shippers on the Buffalo market were dissatisfied not only with the price they received but with the way they had to do business. They all went on the Buffalo market and of course, could not sell their peas for local consumption so when they were stuck with their loads the local shippers bought their peas at their own price. In desperation they decided to organize their own shipping association in 1908.

Some of the prime movers were E. M. Burnett of Orchard Park, also first president, Wm. H. Abbott, Armour, J. C. Newton, Hamburg, Wm. D. Henry, Eden Valley, Henry Bley, Eden, Albert C. Dudley, Orchard Park, Harry P. Waters, East Aurora, Chas. J. Fenner, Orchard Park, Edward Heinrich, Boston, Geo. T. Zittle, Eden Valley, Wm. T. Hickman, Eden Valley, Theodore Gerkin, Orchard Park, Millard F. Webster, Eden, Joseph Peters, Brant, Jacob Riefeler, Hamburg, Frank Bunning, Orchard Park, Geuting Bros., Hamburg, Chas. H. Haushalter, Hamburg, Harris Hessel, East Aurora.

They incorporated for \$5,000 and 51% of the stock was sold. They opened a shipping house on Michigan & Perry St., on the Buffalo Wholesale Market. After one year in this location they moved to the old Peoples Gas Plant at 549 Elk St., where they stayed for two years. They then moved to Orchard Park in 1911, with a branch at Hamburg and North Collins. In 1913 the North Collins and Hamburg stations were discontinued.

The first years of the Association, the shippers gave them stiff competition, and paid good prices for the goods. Some growers dropped out but the association grew by moving into

the shipping district, a long haul for the farmers was eliminated. Raising the price of a share to \$20.00 in 1911 discouraged new members. During 1915, 1916 and 1917 interest in the association lagged and their property would have just about paid their outstanding obligations.

In 1918 a re-organization took place and their present manager was employed. A trial membership was instituted, a member paying \$5.00 a year till his share was paid for. Many new growers came in and the association prospered. All of the buildings except the original packing shed were built, since that time.

The original charge per package handled was 5c was raised to 6c, a very small increase considering the increase in prices generally.

Are four things which this association now has which should assure its continued success are:

First: Sufficient capital and surplus. From being practically without net assets in 1918 they have built up a surplus of at least \$4,000 so that their capital and surplus stands at \$50,000 now. Interest is paid on the stock every five years

VOL. 115 April 4, 1925 No. 14

Barley for Oats

ON Page 367 of this issue there is a discussion that will interest dairymen on growing a mixture of barley, oats and Canada field peas for feeding purposes. There is much in this suggestion, but whether you are interested in doing that or not, we think attention should be called especially to the fact that barley is much higher in real feeding value than oats. According to Professor John H. Barron of the New York State College of Agriculture, barley will on the average produce from 40 to 50 per cent more digestible material to the acre than oats. This applies especially to the richer soils.

Except for the disagreeable beards of barley, there is no real argument against substituting barley for oats and there are many advantages. It may be harvested at about the same time, it grows less dense than oats, is less liable to lodge, and does not require so much water to carry it through. It is a much better crop to seed with. The best varieties are six-row Featherstone and two row Alpha.

Save the Wild Flowers

ONE of the pleasant memories that we have of springtime of other years was of taking a basket and going off on the hills, to the woods which had not yet started to leaf to hunt for that rare and fragrant flower, the trailing arbutus. To those old and young whom the long winter has confined, there is an indescribable joy in getting away on one of the first warm days to the hills to find nestling almost out of sight the pink and white and fragrant little blossoms of the arbutus. These same flower lovers come to know and to love the wild flowers that are peculiar to each season, from the arbutus, the first harbinger of springtime, to the wild aster, that blossoms on in the late fall, in spite of cold and frost.

But unfortunately, many of the rarest, finest and most beautiful of our wild flowers are rapidly becoming extinct, and the trailing arbutus is among this number. In gathering them, the flowers are torn up roots and all, which means that next year there will be fewer of them, and the next year still fewer, and so on until the natural supply is exhausted. They should be cut or broken carefully, instead of being destroyed, as we have seen our precious field violets treated every spring by hundreds of city people who come out every Sunday and fill bags and newspapers with the entire plant, not just the blossoms. In places near the big cities, where the ground used to be blue with violets, the patches

grow smaller every year, due to the depredations of those who do not know or do not care what ruin they cause.

If this carelessness applied only to those flowers such as the devil's paint brush and the daisies, which have become general nuisances, it would not matter. But these are passed by while the trailing arbutus, the azelia, the fringed gentian, the lady's slipper or pink moccasin flower, the dogwood and many others of the finest and rarest are the ones that suffer.

To help the work of saving wild flowers along, the Garden Club of America has a committee on the conservation of wild flowers at work trying to get people to cooperate to save for the world these beautiful and mysterious expressions that Nature has given mankind for its happiness. We take pleasure in passing on to farm people who live where the wild flowers grow the suggestion that we all work together to prevent the absolute extermination of rare and beautiful flowers.

A Good Job

IN 1916, many of the farm bureaus cooperated with schools and with boys and girls to collect the egg masses of the tent caterpillars, often called the apple tree worm. Through this work, literally millions of eggs were collected and destroyed and we believe that as a direct result there were several succeeding years when the tent caterpillar was not much in evidence.

Last year, they had begun to come back in such numbers as to mean a serious menace to the foliage of trees and some of the farm bureaus, two in particular, Nassau and Westchester, have again cooperated with schools and other organizations to collect and destroy the egg masses. As a result of this campaign in the one county of Westchester, 1,827,661 tent caterpillar egg masses, each of which contained about 400 eggs, were cremated in bonfires on Saturday March 7th. The great majority of these eggs would have hatched young caterpillars during the spring to destroy the foliage of trees and build the large white nests which cause the unsightly appearance of the otherwise beautiful highways throughout the country. In Nassau County, Mr. H. C. Odell, the farm bureau manager, reports that at least 200,000 egg masses will be destroyed.

Watchers of Flocks

That those having to do with the care of animals have a quality not possessed by men engaged in other farming and ranching duties has long been a subject of comment. Men whose lives are spent in close association with animals, especially the breeding types, are as a rule soft-spoken and gentle in their ways.

This is a notable characteristic of those who have charge of sheep. An intimate relationship results between the shepherd and his flock that is beautiful to contemplate. The bond manifests itself in many ways and never fails to touch the sensibilities of those who find so much to admire in nature that they never lose their contact with the best things in life.—*New York Tribune.*

WE were pleased with this fine bit of true sentiment. The same principle applies almost equally as well to all tillers of the soil. There is something about association with growing things—whether they be plant or animals—and with constantly living outdoors in harmony with the sun, the wind and the rain that brings out and develops all that is best in the nature of man.

A Good Book

ONE of the most attractive, readable and interesting books on farm life and its problems that we have seen in a long time is "Kelsey's Rural Guide," written by David Stone Kelsey and published by the Atlantic Monthly Press at Boston. The price is \$1.50.

Mr. Kelsey is very well known to readers of AMERICAN AGRICULTURIST as a regular contributor to our columns. He is a Connecticut farmer and his writings are especially worthwhile because they are founded upon his everyday practical experience, expressed in the everyday language of the farmer and backed by a humorous and philosophical point of view that is equalled by few farm writers.

American Agriculturist, March 28, 1925

Incidentally, we think it speaks well for the quality of material which appears in AMERICAN AGRICULTURIST that several of our regular staff writers are the authors of successful books written by men who are actually living upon the farms. These authors who write regularly for us include Mr. Kelsey; Mr. Jared VanWagenen, Jr., the author of the attractive little book called "The Cow," and now working upon the agricultural history of New York State; Mr. M. C. Burritt of Hilton, New York, who wrote the book entitled "The County Agent and the Farm Bureau," and F. G. Behrends the co-author of a valuable text and treatise on Farm Mechanics. Mr. Behrends is our Farm Engineering Editor.

"Kelsey's Rural Guide" has a very interesting introduction by Charles M. Gardner, well known throughout America as the editor of the National Grange Monthly. Some of the outstanding chapter titles of Mr. Kelsey's book are: Life More Abundant; America, the Land of Opportunity; Liberty and Living; A Real Home; The Foundation of Success; The Home Garden; The Blessed Small Fruits; The Secrets of Fertility; Farm Foliage Crops; Markets and Marketing; The Laughter of Life; The Rural Grange; Country Schools and Churches; Rural Books and Periodicals; and many others.

We wish that the "Rural Guide" might have an honored place in every farmer's library.

Results From The Kill a Kow Idea

THE first of March was the date which we placed as the closing of our "Kill A Kow" campaign. As far as the actual signed slips that we have at this office are concerned, they did not quite reach the minimum goal which we set, so no one of the signers is under any obligation to kill his cow if he does not wish to.

However, the actual number of farmers who did kill a beef during the winter was very large. Hundreds of these men have written that they did not sign the slip but they believed in the idea and preferred to do it rather than talk about it. We know that there are hundreds of others in our territory who have done the same thing.

We feel that the idea is 100% right from any way you look at it. A cow that does not pay her keep is a liability to her owner and to every other dairyman, and when fattened and killed her meat makes a real addition to the diet for a long time, particularly when care is taken to properly can it. The whole idea of the campaign was to get men to think about reducing the cost of production and thereby increasing the dairy profits by eliminating poor producers. A start has been made; let's keep it up.

Eastman's Chestnuts

ONCE upon a time there were three farmers, Jim, Tom and Bob, all good friends. Jim was an atheist, and believed neither in heaven nor the other place.

One sad day in haying, Jim's team gave a sudden start and he fell off the load and broke his neck. Tom and Bob came sadly a day or two later to attend Jim's funeral, and as they sat quietly waiting for the services to begin, suddenly Bob was horrified and shocked by Tom's breaking out into a fit of laughter.

"Why, Tom," whispered his friend, "stop your noise! What are you laughing for?"

"I—I can't—help it," roared Tom. "HERE'S JIM ALL DRESSED UP AND NO PLACE TO GO!"

Quotations Worth While

Oh, many a shaft at random sent
Finds mark the archer little meant
And many a word at random spoken
May soothe, or wound, a heart that's broken.
—SIR WALTER SCOTT.

"How happy are all free peoples,
Too strong to be dispossessed;
But happier far the people
Who dare to be strong for the rest."

What Readers Like In A. A.

Best Letters Chosen From Hundreds Received This Winter

IF every one who thought well of your paper should write you a letter as you request I fear your electricity bill and your editor's nerves would be at high tension from night work.

Were I to place in first rank the "article or policy" of your paper that strikes me most forcibly it would be your editorial articles by Mr. Eastman.

The "policy" of your paper as determined by your editor ranks, in my estimation, at the very highest peak of editorship for farm papers and magazines. "Useful and helpful" seems to be your slogan.

We have a great variety of farm magazines in this country. Some contain articles of such a decidedly optimistic tone that it makes one feel like saying "bosh" or something equally as impressive, because they try to make the farmer feel that his trials are over and the smooth rosy road lies just ahead.

Others are at the opposite end of the pendulum swing. I suppose they have their mission but the only one I can see is to lend poor consolation to discouraged men and women who are looking for some one to blame for the existing conditions.

"At Neither End of the Pendulum."

For me the good old AMERICAN AGRICULTURIST is at neither end of the pendulum but is hewing away at the position we are wont to call the "common sense" part of the swing. Optimistic, but not too much so; pessimistic, but not too much so. Seeing the conditions as they are and then going at them with a determination to better them if possible. As an illustration take the accomplishment of the land tax reduction. Going at it from an editorial standpoint and giving us an educational bill-of-fare—then asking us to sign the insert and return to the A. A.—taking these signed statements before the "authorities" and getting a reduction of \$8,600,000 on the land tax for the benefit of the farmer. That is service and the kind we all ought to appreciate.

The position the A. A. took on the educational bill before the legislature last year is another proof that it is at the center of the oscillation. Neither radical nor too conservative but pointing out the best road.

Why's and Wherefores of Markets

The next best article I consider the weekly market review. It is not a mere market report but is a genuine review. It tells the conditions and what causes those conditions, giving a good idea of when to unload and when not to do so. That is of immense value to the farmer and if he would make more use of it he would help to solve the greatest problem before him today—that of marketing his goods. A local shipper of stock and poultry once asked me what good the AMERICAN AGRICULTURIST was. I said the market review was worth many times the cost of the paper to the farmer. He replied: "Damn the market review for the farmer." Of course—by keeping him ignorant of the value of what he has to sell Mr. Shipper can buy cheaper and so make more profit for himself.

Service Bureau a Help Bureau

Third I would place your "Investment Articles and Service Bureau." These have certainly helped many an innocent one and brought many settlements that would not otherwise have been brought about.

Your "contributed articles" are all good and I would not detract from any of them. They serve their place—that of educating your family—but these others stand out preeminently

as the policies that bring "direct results."—C. N. P., Chautauqua County, N. Y.

* * *

Has Read A. A. For Over Fifty Years

I AM sixty-six years old. I have been a reader of AMERICAN AGRICULTURIST for over fifty years. My father took the paper when it was a monthly. It is not as large as it used to be, but when it tells the truth, the whole truth, and nothing but the truth, it is large enough.

As to what part of the paper I like the best, it is hard to say. It depends somewhat upon what I want to know. Perhaps it will be in-

Skip This Page If You Wish

SOME weeks ago we offered prizes for the best letters giving suggestions on what our people liked best in American Agriculturist. We are doing our best to make the old American Agriculturist of interest and service to every one of the many farm families who receive it, and we felt that the readers themselves know better than anyone else how best a farm journal can serve them. We were swamped with replies and the general tone of these letters showing the great satisfaction with which the paper is received in many thousands of farm homes is one of the finest experiences of our life.

The letters were so enthusiastic about the paper that we hesitated for some time about publishing them. There were not enough criticisms for we know that we are not perfect and make a lot of mistakes, but we finally decided to print them, knowing that you do not have to read them if you do not want to.

The best letters were chosen by one not connected with the editorial staff, so at least you do not have to take our judgment.

We want to take this opportunity to express our sincere appreciation for all of those who wrote us in such a helpful way. We would like to publish more of them if we had room, but every one who wrote us can be assured that every comment and suggestion has been given careful consideration by our editorial staff in an effort to improve quality and service of American Agriculturist.

—The Editors.

dictated by what I look to first.

Well, I always look to the editorial page first, for I know if there is anything of special importance the Editor will point the way. And, at the bottom corner, I read Eastman's Chestnuts, and that puts me in a good humor for the rest of the paper.

I especially like the writings of H. E. Cook and Jared Van Wagenen. I have received many times the price of the paper from Mr. Cook's advice on spreading manure. When my son was on the cruiser *Salem*, stationed at Vera Cruz during our little trouble with Mexico, the soldiers were ordered to land. They were fired upon by Mexicans from upstairs windows. The sailors huddled close to the wall and went forward. The captain ordered the Mexicans to cease firing or he would demolish their buildings. Finally, the firing ceased and the American flag was floating above the main building. Jim (that's my son) said the flag never looked so beautiful before, and he felt a lump rise in his throat and he rejoiced that he was an American citizen. That is the way I feel when I read Van Wagenen's writings.

I especially like your market reports for I have found them reliable. I also always look over the advertisements, and if there is anything I want, I am not afraid to send for it, because I know you stand back of it.

For a number of years, I taught school, and I very much liked the stand you took on the school question last year. The high taxes in

the Hill Country are one thing that is driving the people from the hill farms. I am heartily in favor of nearly all of your tax program. I approve with emphasis the following: A carefully prepared budget, full publicity of all money spent and for what spent, gasoline sales tax, and no tax free bonds. But I think an income of a million dollars should pay just a million times as much as an income of one dollar. I am opposed to the raising of all salaries of public officers. Whenever a public officer asks for an increase of salary, he should be asked to resign.

Last, but by no means least, I like your stories. "The Hound of Baskerville" was a good story of its kind; but for a family journal such as AMERICAN AGRICULTURIST, stories like "The Brown Mouse" or "The Trouble Maker" are much better suited. "The Trouble Maker" is a good, wholesome, interesting story, better even than the "Brown Mouse" and that is saying a good deal.—J. S. B., Broome County, N. Y.

Stands for a Square Deal

SINCE you have asked for letters discussing the AMERICAN AGRICULTURIST, its writers, artists and policies, I thought I would do my bit.

We have had the AMERICAN AGRICULTURIST in our home ever since my husband and I began our married career.

To my mind, the greatest principle which the AMERICAN AGRICULTURIST stands for is its strict honesty and a square deal every time. There are so few places where we farmers get a square deal that we know how to appreciate one when we get it. We know that the AMERICAN AGRICULTURIST stands for honesty, not only from hearsay, but also from actual experience. Not long ago my husband had some dealings with an advertiser in this paper. The man he was dealing with seemed to forget for the time being that he was dealing through an honest magazine. It was only necessary to remind him of the fact, however, to get justice.

The editorials too are those of interest to the farmer. From them he gets the current events of the day condensed to mere facts. This is a great saving to his time.

Then I think the story section comes next in importance. Neither my husband nor myself have ever missed a single story since we began taking your paper. Your stories are always so interesting and exciting one can hardly wait a whole week to see what is coming next. They are the kind of good, wholesome stories that it does one good to read.

Next comes the Service Department, ready to aid us in getting any information we desire. We have availed ourselves of this privilege also.

The busy farmer woman has very little time to study fashions after her numerous farm duties are performed. She has only to glance at the fashion page of the AMERICAN AGRICULTURIST and dress accordingly to look as trim and up-to-date as her city sister. It is no longer necessary for her clothes to be so out of date. She gets the latest styles every week. So with very little work her old clothes can be made over, and new ones can be made after the latest patterns.

Marketing is surely worthwhile to the farmer. It is he who raises the fruit, vegetables and grain to sell. By studying the market prices in the AMERICAN AGRICULTURIST each week he knows practically what he should get for his products. The price lists serve also as a protection for him in case he wishes to buy.

I have found the recipes which I have tried out to be very good. Let us have more of them for the preparation of the fruits and vegetables raised on the average farm.

My husband and I have been particularly interested in the discussions on poultry raising and dairying. One never knows so much about these things that he is not willing to learn more.

When the AMERICAN AGRICULTURIST arrives at our house there is often quite a discussion to find which one gets the chance to devour its contents first. We have often settled this dispute by taking turns reading aloud. We think the AMERICAN AGRICULTURIST the best farm paper we are taking, and would not think of getting along without it. S.M.B., Wayne County Pa.

"DESIGNED" OIL

Socony Motor Oil is literally built to specifications. It is precisely and exactly a "designed" oil.

No matter what type of tractor you use, its efficiency in pulling power and stamina is in direct ratio to the kind of motor oil you use. Lubrication is the life-blood and reserve strength of the "iron horse".

With Socony Motor Oil, not only is the power efficiency increased, but there is a freedom from worry—a cool engine, plenty of reserve for that last quarter acre when you must dig in and hold to it, if you would turn a furrow.

There is a grade of Socony Motor Oil for every make of tractor. Consult the lubrication chart below. The nearest Socony dealer will be glad to quote you prices in metal 30 or 50-gallon drums, with faucet. It costs no more, and it is mighty convenient.

Remember that SOCONY is "Standard"

How and When to Graft Plum Trees

Can you give me any advice on grafting plum trees? I have good success with apple or pear but very poor with plums. I would like any advice you could give me on grafting plum trees and cutting and caring for scions.—L. R., New York.

If you had not good success with apple and pear grafting I should not feel safe in encouraging you as I do below upon the more fussy job of plums, cherries and the like. Moreover, I must begin by asserting that plum and cherry grafting—and especially the plum, is not a commercial proposition. The only excuse I could make for grafting one of these trees myself would be that it stood in a favorite spot or near buildings where it was particularly wanted and was itself still young and vigorous. No kind of surgery works well on these trees when their wood begins to be old.

Work When Sap Is Watery

There are two "wrinkles" which must be very, very carefully handled to insure success in plum grafting: The cutting and caring for scions and the stage of growth conditions in the stock. The above two potent factors are further complicated by the fact that we are here dealing with trees of gummy sap, as all pit or stone fruit trees are. And this gummy, bitter sap is such a handicap in the case of the peach and apricot that grafting is very seldom attempted. It is only when the stock has started into rapid growth as in warm days of late May (latitude 42 to 40) that grafting them has much chance of success. This is the time when their gummy sap is most fluid—carrying such an excess of water that its tendency to almost instantly turn red-brown wherever a wound is made is at the minimum. We have here the same conditions which cause the nurserymen to transplant the even more gummy evergreens at or after June 1st—when their sap is nearest fluid and spring growth rushing forward.

Handling the Scions—Avoid Drying Winds

The man who is uniformly successful with the seed fruits (such as apples, pears and quinces) may try to graft the pit fruits by closely following the below directions, though he will probably never produce a high percentage of successes.

(a) Cut the scions with as much heavy wood attached as possible, as late in March as possible, though while they are still dormant.

(b) Keep these in the coldest possible place which is both damp and dark. They are more easily injured by drying and more sensitive to heat than seed fruit twigs.

(c) Delay until the leaf buds on the stock to be grafted are bursting and green—almost open, then go to it.

(d) Graft only on a damp day, or even in the rain. At least when there is no wind or sun and operate very quickly, with very sharp knives to avoid discoloration by oxidizing above referred to.

(e) Take extra pains to accurately match the edges of the cambium layer of the "just whittled" scion with the stock.

(f) Instantly enclose the whole job, making water-tight, with a well-prepared wax—preferably in the form of rags saturated in the hot grafting wax, and finished by dressing the whole job—scion, waxing and stock—with a rubbed-on coat of lard.—D.S.K.

Recommendations From Cornell

The stone fruits are generally more difficult to graft than are the fruits such as apples and pears. Apparently the greatest success with such fruits as the plum is gotten only when both the scions and the tree are absolutely dormant. This means that the work would probably have to be done in very early spring or even in fall. The scions, of course, should be cut when they are dormant as soon after the leaves have dropped as possible, and kept from drying out by preserving in sawdust.

If possible, I would prefer to bud rather

(Continued on page 377)

Five Years Ago and Five Years Ahead

Five years ago we sold several thousand fruit trees. This summer their happy owners will watch them bear absolutely True to Name fruit and will reap the substantial reward that is due them for buying carefully and investing land, labor, fertilizer, and, most of all, TIME.

Five years from this spring YOU will await the fruit from the trees that you are going to plant this year.

Buy carefully now. Disregard a few cents difference in price—one way or the other. (Price of fruit trees is no indication of their value.)

Plant Kelly Bros. trees BECAUSE they are guaranteed and certified absolutely True to Name. They will produce exactly the kind of fruit that you select now.

65,000 of our this year's trees bear the lead seal of approval of the Massachusetts Fruit Growers Association to stay there until the tree bears True to Name fruit, as guaranteed by us.

Take the First Step Today Send for 1925 Catalog

This handsomely printed book pictures the entire line of Kelly Certified and guaranteed True to Name Fruit Trees, Berry Bushes, Shrubs and Ornamental Trees. All orders, large and small, are filled in rotation as received, so you will need the catalog at once to get your order in early. Send for it today.

The April Rush

Things We Should Do But Often Forget

Of all the topics of conversation outside the barn, reference to the weather is always taboo in polite society, but do you know of any one factor of "living" that enters more into the calculations and plans of everybody, and that is oftener a disturbing, modifying factor in farm plans and operations?

The contractor, after figuring all other expenses carefully, usually adds a twenty percent "margin of safety" on account of unforeseen weather conditions. The average farm operation, and even farm crop, may almost be said to make or break upon the turn of weather.

D. S. KELSEY

A man may have the best farm in town; abundance of fertility; seeds of vitality; perfect tools; excellent management, sound judgment, and experienced and reliable farm help. He may combine these perfectly, putting the right action in at the right time, and start what should be a wonderfully profitable crop. He has done everything a man can do to insure and deserve success.

Nature Has Her Inning

Then Nature steps in, and tapping him on the shoulder says, "You've had your chance, now it's my inning," and there comes a late spring, a drought, or torrential rains, or frosts, or wind, freezing, burning up, washing away, or blowing to shreds the proudest farm crops ever produced.

And yet thoroughness and timeliness are the best insurance against failures of every sort, and this is even more true at the outstart—in getting the jump on the rushing spring work.

As soon as the winter water has passed out of the soil—partly by the downward process of leaching, and partly by evaporation—field operations should begin. Not a day, not an hour should be lost. While waiting, every tool should be made ready, every operation thoroughly and carefully planned, and the teams hooked up daily and given road exercise or actual jobs that will harden them for the coming struggle. There is no period of haying or harvesting more crowded than the early spring days of field work.

Tilth As a Guide

The safest guide to beginning operations is the tilth of the land. A soil is ruined by being stirred when at all wet or sticky, but the moment it will crumble—that is the moment to begin. Sandy soil will come into condition earliest, loam soil next, while clays, gumbo and muck are slower in drying out. These last however, should be watched closely for when too dry they are worked with the greatest difficulty.

This brings up another important consideration in April management. For instance, take a transplanting machine. A gang of three or four men and one double-horse team will perfectly transplant two or three acres of cabbage, strawberry plants, tobacco, or a dozen other things in a short day, provided the soil is in exactly the right tilth—neither too dry nor too moist, and experience, plus good judgment, plus close observation—all these are required, to watch for these conditions.

Be Ready For a Rainy Day

Sometimes a shower will drive a transplanting gang into the barn, and conditions following will not permit return to that field again for a week, and

nevertheless, the land has to wait and then be also reworked with the Acme and Meeker.

As to rainy days after April 20th and until about August 20th, there usually is not more than one really rainy day per month, and these should be a pleasure both to the farm help and to the teams. Better let the men off or at least merely suggest a "rainy day job" of their own choosing, that they will take an interest in.

This being the case, it is futile to leave any small spring task undone, "until a rainy day". It will be found that, by thoughtful foreplanning, about everyone of these could have been attended to in March or even the February before, and better done—because done more at leisure and for the excellent reason that a tool, for instance, put and kept in perfect working order is doubly effective and valuable.

Timeliness the Big Thing

On one occasion we were searching for leaks in our own management and found we had spent fifteen percent, or in one season almost thirty per cent, of our April working hours upon such items as these: Mending—fences and gates, wagons, machinery, farm roads, and miscellaneous repairs to buildings. We now think every such item is almost like the effort thrown away. Not one precious hour of April can rightly be afforded on such things. The most important factor of farm success is timeliness. To get in an oat crop, for instance, ten days later than it should be often spells a fifty percent yield—all profit swept away, to the point of an actual loss.

The man who grows market garden stuff is above all dependent upon making every moment of the early weeks count. He probably has some "early", somewhat sandy land naturally friable, drying out early and quickly. A dozen important early crops—the planting of peas, onions, cabbage, beets, carrots, parsnips, spinach, and the transplanting of horseradish, asparagus, rhubarb, etc., can often be performed on such a tract in late March, while there will still be hard freezing and snows ahead. It is all a question of preparation, of close watching for favorable conditions, and then taking advantage of them.

Applies to Fruit Growers and Dairymen As Well

It is not that these will grow any earlier than if the work were done in mid-April. It is something more important than that—getting the job done and out of the way, getting the jump on the April rush—the days when there are ten things suffering to be done to one actually accomplished.

To be at all a successful fruit-grower, one must exert himself to the utmost to avoid being rushed in April. His, the date of "pre-pink" spraying is bound to be a free-for-all guessing match—until almost the very day to get his outfit into the orchard. When the latest safe day actually comes—then, Oh then let him snap to it indeed, but let it not be at the expense of half-a dozen other jobs that might, could, and should have been done and out of the way in March or early April.

And the dairyman can least of all afford to find himself caught in the whirlpool of an April rush. His whole success depends upon the utmost efficiency in getting things done, and on time. He must cut every corner, eliminate all waste time and effort as well as waste materials, just to "live". His daily field hours are short and it is to him imperative—that each tool be bright and taut; each machine pre-pared and ready to hitch on to. His long, bright March days should go into these items and

WOLVERINE

The 1000 Mile Shoe

The Planter

Low enough for comfort, but high enough to keep out dirt.

Kinsman, Ohio, 4-18-1924

Wolverine Shoe & Tanning Corp.

Dear Sirs:

I see in the Ohio Farmer tonight where Amos B. Kirby thinks you have a fine work shoe and I agree with him. Only he don't seem to get as much out of them as I do. Now I bought a pair of Wolverine shoes of C. E. Hodgkin at Whittier, Iowa. It will be three years in June and I used them all the time until April 1, 1924 and on a farm at that. I do my own half-soleing and put three pair half soles on them. They were the best shoe buy I've ever had.

Yours truly

(signed) A. G. Mampton, Kinsman, O.

It wears 1000 miles and stays soft—wet or dry—genuine horsehide tanned a new way!

Men, here's something new in a work shoe. A shoe that actually wears 1000 miles and more. Try it and see for yourself the amazing wear you can get out of this horsehide Wolverine. Thousands write us that they never believed it possible to make a shoe so soft and easy on your foot—yet so hard to wear out.

The secret of this shoe is our leather. Genuine Cordovan horsehide. The toughest wearing leather known. It's horsehide leather that covers big league baseballs. No one has ever found it's equal to withstand hard knocks. For centuries the finest Cossack saddles have been made of horsehide. Army officers' boots too.

But, until recently, this leather could never be satisfactorily used in work shoes. It always tanned up too stiff. Now in our own tanneries we have a special process that makes it pliable. *Actually softer* than ordinary leather. And it *always stays soft*.

Even after many wettings it dries out soft as velvet.

Did you ever find this in a work shoe before?

Only the choicest hides go into our Wolverine shoes. We tan them ourselves. We start with the hides and produce the entire shoe. And we make work shoes only. We are specialists. That's why you can expect to find these shoes different from any others. And you won't be disappointed.

There's a Wolverine shoe for every need. Farm, shop, railroad, mines, oil fields or woods. There's a style that will suit you exactly. Send today for our complete catalog.

If your dealer hasn't Wolverines, please write us. We will send you our catalog and the name of nearest Wolverine dealer.

Wolverine Comfort Shoe

This Wolverine is so pliable and soft you can double it up like a moccasin. It wears like iron but you'll hardly know you have a shoe on, it is so soft and easy.

For tender feet, or where you do not encounter wet weather, wear this Comfort Shoe. A blessing to the feet.

Watch Your Seed

Some Hints That Will Save Dollars

THE lengthening days, the high sun at noonday, the swelling buds and the old almanac hanging on the wall all remind us that winter is past and that the real work of the year is at hand. The first item in the spring's program to which we must look with care is the supply of seeds.

The germination of seed corn available for this spring's planting appears to be so low that grave situation is facing the farmers of the State and Nation. The federal department of agriculture reports germination throughout the country ranging from zero to 90 per cent. The origin and condition of grain seeds, also are matters needing careful consideration.

The wet cool weather last fall resulted in much imperfectly matured corn, all with an excessively high degree of moisture. The vital germ cells, of such corn is highly susceptible to the growth of molds and bursting of the cell walls from the effect of the frosts. The vitality of such broken moldy cells and kernels containing them is thus destroyed and the corn becomes worthless for seed.

Similar to Situation in 1918

The results of such ripening conditions in the fall of 1917 brought a catastrophe in the seed corn supply of the nation during the spring of 1918. Corn of germinating power above 75 per cent was difficult to find. Much corn with such germination in January dropped to 60 per cent in February and March, and to 30 per cent in May. Great losses in stand and crop resulted. Indications are for a repetition, in part at least, of

By C. P. NORGORD
Assistant Commissioner, New York State
Department of Farms and Markets

the 1918 conditions this spring.

A bushel of worthless seed corn, planted, means approximately six acres of crop lost and a single worthless ear results in a loss of five bushels in the crop. In view of this threatening situation, wise farmers will carefully test each lot of seed corn before planting. Seed corn in ears, each ear tested separately, is safest. Kiln-dried seed holds its germinating power and all farmers should use it. Immediate action to test will make possible the purchase of new supplies should some prove worthless. If you must purchase, do so at once, preferably with the advice of your county agent.

If you have well cured, well bred seed corn for sale, notify your county farm bureau manager, that you may benefit from the sale, and others from this source of good seed.

Clean Seed as Well as Test

The cleaning of seed grain also demands your attention. Most oat kernels grow in clusters, chiefly triplets. The third kernel of each triplet is a dwarf, known as a "pin oat". Pin oats and other small kernels all lack sufficient food to start the baby plants off with vigor. Weak plants and a poor yield at maturity, results.

Failure to remove these kernels having a limited food supply is the main cause of what is commonly known as "running out" of seeds on certain farms and in certain communities. Where the fanning mill is faithfully used to remove these small weak kernels there is no such a thing as "running out." To make this rigid selection farmers should get out their fanning mills or borrow their neighbor's mill and with wind and screen vigorously and without qualms of conscience separate out from their seed grain and remove one-half, comprising the small light kernels. Use the remaining half, the heavy plump kernels, only for seed. The discarded part can be profitably fed to the stock. Be careful, however, that the cleaning process is not delayed until the stock have eaten you out of the opportunity to make this selection.

Beware of Weak Garden Seeds

Many varieties of garden seeds are low in vitality and annually cause great losses to gardeners large and small. While the value of each individual purchase is not large, nevertheless many people of moderate means, both in the city as well as the country depend upon their gardens for a very necessary variety of their diet. The loss of the garden to many people through poor seed is a very large total loss indeed. The State law does not offer adequate protection on garden seeds, hence the only recourse is to buy from known reputable seedsmen.

Insist on Northern Grown Clover and Alfalfa Seed

Failure of thousands of acres of red clover and alfalfa in years past have been due largely to the use of southern or foreign grown seeds, not adapted to New York State conditions. Investigational work in many states has proven that clover and alfalfa seed grown in other than northern areas failed to winter over in the latitude of New York State. A conference of seedsmen and growers at the Department of Farms and Markets recently placed emphasis on this matter, so that leading seed-houses are this year paying special attention to the location where their seeds are grown.

"As you sow, so also shall you reap". The way to secure a good and satisfactory harvest is to look to the quality, germination and productive power of the seeds that you are to sow.

A Successful Farmer Tells You How to Succeed

DAVID STONE KELSEY is a successful farmer who has spent a life time studying every day farm problems. He knows the answers to a thousand live questions about farming and he puts them all in a book that costs no more than the price of a new hoe. There is nothing else like it in print. One man says:

"It would have been worth at least a thousand dollars to me through the last three years."

Here is a live, aggressive book on real living, rural issues. You won't find it too long or too scientifically worded. Farming as a business is discussed with a full study of the leaks and losses where petty details are not fully grasped, the well-worn path to real success. And it will cost you only \$1.50! Send for your copy today!

What Readers Like in A. A.

(Continued from page 351)

A Word for "The Trouble Maker"

IF you would ask me what I consider the best article in your paper I would unhesitatingly answer "The Service Bureau." While I have never used it, many, many of your readers have and I know if I ever have the need, it stands ready at my disposal. Then, too, the investment articles, what a help they have been in saving your readers from losing thousands of dollars every year. Truly, these two articles which give such practical aid to the farmer, are worth many dollars to him, and AMERICAN AGRICULTURIST would be worthwhile if there were not any other good articles in it.

The articles published regularly on poultry, dairying, sheep, swine, farm crops, fruit, etc., are splendid, and no doubt if we were all financially able to put them into practice would yield great returns on the money and work invested.

Have especially enjoyed the articles on farm life by Jared Van Wagenen, Jr. It is quite a pleasure for farmers living in different parts of the country to read his beautiful descriptions of farm life in other regions and to know what other people are doing.

The Home Page is excellent, too, appealing, not only to the womenfolk, but to the men as well. Occasionally, before I get a chance to read the paper, friend husband will tell me about some good article he has read pertaining to the home, care of the children, etc. I ask, "Where did you see that?" and I know before he replies, "In the Agriculturist." You can better this work by publishing more of it.

We would be pleased to read a non-sectarian sermon each week. The spiritual side of the farmer's life must be emphasized as well as the material.

"A good laugh is the best of sauces," so runs the old saying, and we enjoy a hearty one when we read Eastman's Chestnuts each week.—Mrs. E. A. E., Delaware County, Ohio.

* * *

Places Service Bureau First

THERE are so many good features about our old reliable AMERICAN AGRICULTURIST that it is difficult to select the one we like best. However, we shall place the Service Bureau first because whether you have occasion to use it or not, you have that secure feeling that if you need to have money collected, it can be done without cost through the AMERICAN AGRICULTURIST Service Bureau. It is an insurance policy without premiums. We had occasion to use it this year to collect a small sum from a Chicago firm who absolutely refused to settle with us. The check was forthcoming in a week after we had written the Service Bureau.

The editorials are always read with interest. They cover the subjects before the public and give us much needed information. Here, we must also mention that we enjoy Eastman's Chestnuts.

The serial stories are good, wholesome reading for our young people and contain nothing for which we need make apology. "The Trouble Maker" is an accurate description of country life and country people. It contains problems of many rural communities.

"Quotations worth while" provide us food for thought and inspiration. They also solve the quotation problem for Grange and club.

Since so many of us have radios, we believe a page now and then devoted to the radio would be a benefit to the readers.

We are such a busy class of individuals that we do not have time to read as much of the news of the day or study the world's problems as much as we should, therefore, it would be to the advantage of all to have short, concise discussions of the world's affairs in our own farm paper.

Mr. H. E. Cook and Mr. Van Wagenen, Jr., are friends of the family and their articles which are looked forward to with interest are the basis for much discussion and information.

The ALPHA Dealer of your Community has a lot of helpful information on Cement improvements

ALPHA CEMENT is produced under the strictest chemical supervision. Every bag of it will give you high-class results.

The ALPHA Dealer can give you a free copy of the new and enlarged edition of the 112-page Handbook on Cement Construction, "Alpha Cement—How to Use It". He also has special Bulletins and Service Sheets on scores of home, yard, farm, business-place and civic improvements—foundations, driveways, storage buildings, garages, gate posts, engine bases, water troughs, house foundations, dams, etc.

You will be delighted with the common-sense value of these helps on permanent improvements, all of which can be made with good sand, gravel, or crushed stone, water, a little reinforcement and ALPHA CEMENT.

The farm news stories place us in touch with our neighbor. We can compare notes and possibly work out our problems this way.

The page for farm women is always read by the ladies of the household. Some weeks we have time for little more, but the paper is never filed away until this page has been looked over, the recipes needed copied on the card index or the pattern for the baby's dress or coat ordered.

There are still many splendid features of the old reliable AMERICAN AGRICULTURIST which we have not mentioned such as the market reports, the discussion of cooperative organizations and the advertisements which are doubly valuable since they are backed by the paper itself; but since words are limited, we finish by wishing the staff of our greatest farm paper all its readers the happiest, most successful year ever, during 1925.—Mrs. G. S. K., Bradford County, Pa.

You must answer
for your wife
and children

YOUR KITCHEN is your wife's workshop. Many are the hours she spends there working for you. In poor light these hours are twice as long in early morning and evening. Do you have poor light in your kitchen?

And your children — are you willing to risk their eyes and general health in injurious and improper light? Are you willing to answer for their bodily welfare and your own?

Colt Light is not a luxury. It is a necessity of the first importance.

With the Colt Light system you can have perfect light in your house and your barns. Besides this, your wife can have a Colt gas

stove and gas iron in her kitchen.

The whole plant, installed and working, costs very little in comparison to the service it gives. There is nothing to wear out or get out of order. Its upkeep is the price of enough Union Carbide to refill the generator two or three times a year. That is all.

Union Carbide for use in the Colt Light plant is sold direct to the consumer at factory prices. One of the 175 Union Carbide Sales Company's warehouses is located near you. Union Carbide is always uniform. World's best quality. Highest gas yield. It is always packed in blue-and-gray drums.

Milking Cows for 36 Years

A Story of a Farmer Who Made Good

THIRTY - SIX By CHARLES M. EAKINS
years is quite

a while to stay with the same job, without any interruption or change, or anything to relieve the monotony. But I have always believed that to make a success in life, one must select a vocation and stay with it. Especially is this true of those negligent young men who do not take advantage of their opportunities to get special training, and who are therefore unable to get a job every time they need one. At any rate, I am glad that I "stuck to the text," for when I look back over my past life I cannot see that I could have done better by selecting another vocation than the one I now follow. It is true that the path has been thorny at times and I have had many hills to climb; but the fact that I have raised my family, paid for my home, and with my son as partner, own a herd of good cows, do a good business and have some money laid up for a rainy day, proves that my labors have not been in vain.

Started in a "Very Small Way."

I started my present business in a very small way. In fact, I could not have started on a smaller scale, as I

ability for making good trades; so my ability to make good trades and my fortune in being strong and robust physically, were my only assets when I started out to make a living for two. I began working for this one and that one as a hired hand, but I never let an opportunity pass to make a trade if I could make a few extra nickels by doing so. I finally traded myself into a good cow, and this was the beginning of my present business.

REAL SUCCESS

I HOPE you will enjoy reading the little story of a life experience on this page as much as I did. As Mr. Eakins says, there are others who have better cows and better methods, but we will wager that there are few who have come any nearer to real success in those things which are most worthwhile.

—E. R. Eastman.

to the neighbors. We continued to add cows as the Lord prospered us and by 1903 we had five or six good cows.

Up until 1903 we had delivered our milk on foot, as we had no horse nor wagon. But on account of our increased business, it became evident that we must have some sort of a horse and vehicle with which to deliver milk. Right here is where I made one of the best trades I ever made in my life. I traded one of my cows for a blind horse, "even up." I also bought an old wagon, and this horse and wagon served us for several years, until we could afford to buy better equipment.

In 1904 we assumed a big debt, as we got money from the building loan association and bought our home, together with the barn and other equipment. I had just \$25 when we assumed this debt, but our business had increased steadily and we were making some money over and above all expenses. We kept adding to our number of cows, and we finally got rid of the blind horse and the old wagon and purchased a better horse and a regular milk wagon. The business continued to grow, and two years ago I took in my son, Robert, as a partner. During the 34 years prior to this I had been the sole owner, and with my two boys had run the dairy without employing any outside help.

We now have 14 first class cows. We sell whole milk, and have sale for all we produce. My son and I run the business without any additional help. My job is caring for the herd, and my son delivers the milk. We have a well equipped delivery truck which we purchased two years ago.

Our cows are not purebred, but for milk production, they are as good as any purebred herd in our section. The production of milk being our only object, we have found that the graded cows, that deliver the goods, are better for us, as we can buy them for less money than it would take to buy purebred cows. Most of our present herd are Jersey and Holstein mixed.

We feed our cows a certain commercial ration which we have found very satisfactory. We also give them wheat bran, corn bran, and clover hay. We give our cows warm water in winter. We have found that it is essential that they drink all they want, which they cannot do if the water is ice-cold. We have both gas and electric lights in our barn, which is very convenient and helps us to give the cows the proper care.

Now, thousands of dairymen have made a better record than I have made, and their stories would be much more

(Continued on next page)

This is Mr. Eakins of Toronto, O., who tells the story.

had just one cow. It was in 1889 and I was a young married man, just beginning to realize my responsibility as the bread-getter. Prior to this time and before my marriage I had not thought of the future. With many other young men with whom I associated in those days, my only concern was to gratify my desires for the present, and have what I called "a good time." As the inevitable result of the lack of a purpose and the wasting of time. I came face to face with the stern realities of life with a flat pocketbook; and, for a time, I didn't know how I was going to make a living, or whether I would be able to make one at all. But very early in my life I evinced fortune in being strong and robust

**EASY, NOW, TO OWN
AN OTTAWA MILKER!**

**ONLY
\$35**

Now, with our Low Direct-from-Factory Prices and Easy Terms, any farmer or dairyman with 5 to 100 or more cows can not afford to be without the wonderful OTTAWA Milking Machine. Soon pays for itself milking only 5 cows. Saves money, time and hard work.

Find out today about this milker that milks the human way; is a self-washer and has no pulsator; no pipes or rods; no springs or valves. Easier to use; easier on cows. Milks 2 or 4 cows at once, 18 to 40 cows an hour. No cost to install; comes all complete ready to milk. Small Down Payment—a Whole Year to Pay.

TWENTY years and a Globe Silo is still in service. Why? They are built of the finest materials—spruce and fir. Heavy matching walls, double splines, sealed joints and adjustable doors make them absolutely air-tight. Not only now, but a generation from now. The extension roof makes a Globe Silo the cheapest per ton capacity—an exclusive Globe feature. Increases value of farm. Durable, convenient and profitable—these are the time-proved merits of a Globe. Write today for catalog and price-list; silos, tanks, ensilage cutters, stanchions, etc.

impressive than mine. But I have accomplished my purpose, which was to own a home, raise and school my children, and make myself independent and secure in my old age. My advice to young men, who have no special training, is to get a job and stay with it; for the longer you work at the same job, the more you will know about its details, and the easier it will be for you to make money.

Try Some Oats, Peas and Barley

BEFORE the days of the great development of city markets for fluid milk, Eastern dairymen bought very little feed. But with the increase of milk consumption and particularly with the beginning of the growing of grains on a large scale in the West, Eastern farmers began purchasing this feed. This practice has continued until on most dairy farms, with the possible exception of a few oats for the horses, there has for a number of years been very little grain grown.

In the last decade, however, conditions have changed. Western grain has become higher and the costs of milk production have been constantly increasing. The result is that thousands of dairymen have begun to figure how they can cut down their feed costs. They know that it will probably always be necessary to buy much commercial feed but more and more also they realize that on a majority of farms the feeding business can be readjusted by supplementing the purchased by more home grown seed. The acreage of alfalfa, for instance, in the East is multiplying itself several times every year. Much more attention is being paid to the seeding and care of clover while soybeans and other legumes are getting a good start because farmers realize that all legumes are very high in protein in addition to being especially palatable.

How Much to Plant.

The practice which we want to speak about particularly, which is increasing rapidly, is that of growing combination of peas, oats and barley. Here is the seeding mixture: Use Canada Field peas, a late two row barley. (Alpha preferred), and any good variety of oats. Mix the seeds at the rate of one bushel of oats, one bushel of barley and a half bushel of peas. The field should be seeded at the rate of from one and a half to two bushels per acre, on fertile soils where there is danger of lodging. As much as two and a half bushels can be used elsewhere, depending upon soil conditions.

The crop should be planted early. Pea seeds should receive legume inoculations before mixing with the other two. Ask your Farm Bureau office to get this material for you. Failure to inoculate may reduce the yield of peas. A yield of 40 bushels weighing 50 pounds per bushel is about average. Average results may be expected from this mixture as follows: 50 per cent. oats, 27 per cent. barley and 23 per cent. peas.

This makes a most excellent ration, particularly when fed with alfalfa or good clover. Of course, it will need some supplementing with purchased feed.

Milk News From Otsego County

MILK must test 4% or more in butter fat content to meet the latest requirements of the shipping station at Roekdale, N. Y., in the Unadilla valley. This station is at the eastern edge of Chenango county and has a large patronage from both Chenango and Otsego counties. It supplies milk to the Childs company for restaurant use in New York City. Premiums paid for excess butter fat have previously induced many patrons to improve their dairies according to the butter fat test standard, and now the company is bringing active pres-

Time Tested Windmill

The Auto-Oiled Aermotor has behind it a record of 10 years of successful operation. In all climates and under the severest conditions it has proven itself to be a real self-oiling windmill and a most reliable pumping machine.

An Auto-Oiled Aermotor, when once properly erected, needs no further attention except the annual oiling. There are no bolts or nuts to work loose and no delicate parts to get out of order.

There are no untried features in the Auto-Oiled Aermotor. The gears run in oil in the oil-tight, storm-proof gear case just as they did 10 years ago. Some refinements have been made, as experience has shown the possibility of improvement, but the original simplicity of design has been retained while greater perfection of operation has been achieved. The Aermotor is wonderfully efficient in the light winds, which are the prevailing ones. The self-oiled motor works with practically no friction, and the wind-wheel of the Aermotor is made to run in the lightest breeze. It is also amply strong to

run safely in the strongest winds. In any condition of wind or weather you may be sure that the Auto-Oiled Aermotor will give you the best of service. It is made by the company which established the steel windmill business 38 years ago.

sure to bear on its other patrons who will be obliged to raise the average of the quality of their product to meet the demand. Otherwise their milk will eventually be rejected. Those dairymen who have not already placed their herds on a high test basis, are planning either a gradual or a wholesale shift from black and white stock to cream producers, the Guernsey being the favorite.

Good Cows Scarce

In making an abrupt change of his entire herd, a farmer is confronted, not only by the heavy expense, but by scarcity of Guernsey cows on the market. Dealers are eager to corner the situation by offering a low price for the cows forced onto the market by the edict of the milk company, and expect to replace them with high priced cows in popular demand. Large cows that are in their prime for heavy milk production are acceptable to go to pastureless farm stables near big cities, there to be milked out and then go to the block. This kind of market will help to relieve the situation, and will save much loss to the dairymen if they can meet the open market season with fresh cows.

The managers of the Rockdale Milk plant have severed dealing with Dairymen's League members. A few of its patrons tried to stand by the League, but finally yielded to the pressure of convenient market facility. In towns where League plants are situated, the contract period passed without excitement, and few withdrawn contracts are reported. Comments of approval have been freely expressed in regard to the article in AMERICAN AGRICULTURIST of February 7, "What Shall We do about the League?" Many League supporters have long felt that some improvements as therein outlined must be made if the organization is to fulfill its purpose of continued service to dairymen.

League Ice Cream Popular

League products have certainly won public commendation of their quality. A road stand ice cream vendor said last fall that Dairymen's League ice cream cost him more in bulk, and was therefore less profitable to handle than another brand which he had previously sold, but that the traveling public wanted Dairylea cream. He could sell that and could not sell the other, but he could not charge extra to make his profit. A similar report has been given by grocers. Inasmuch as the dairymen organized and supported the League that they might share in the benefits as well as the burdens of their business, the need for reduction of expenses should fall somewhere between the purchase price of the raw milk and the final sale of the finished product in competition. Otherwise, the dairymen, and the last retailer, or the consumer, if the retailer passes the charge on, may not be willing to continue patching the leaks. Economy in transportation and manufacture are as needful as economy in production, and administrative economy is just as essential.—C. F. M., New York.

Waldorf Farms Makes two Records

Waldorf Farms located at North Chatham, Columbia County, have just completed records on two cows that place them well forward in the Honor Roll of Guernsey producers. Clifford E. Greene, superintendent of the Farms writes as follows:

"We have just completed a record on a New York State Champion for 1924—Waldorf Marie Antoinette. She produced 14,614 pounds of milk and 717.83 pounds of fat. She is the 1924 champion in Class E. The other record was in double letter class, Class GG. This is a national class and the individual takes 9th place in the class leaders on the Honor Roll. She is Waldorf Periwinkle. She produced 10,548 pounds of milk and 657.6 pounds of fat. She also took 4th place in the Eastern States Exhibition this year on test.

White Diarrhea

Splendid Success of Mrs. Ethel Rhoades in Preventing White Diarrhea

Mrs. Rhoades' letter will no doubt be of utmost interest to poultry raisers who have had serious losses from White Diarrhea. We will let Mrs. Rhoades tell it in her own words.

"Gentlemen: I see reports of so many losing their little chicks with White Diarrhea, so thought I would tell my experience. My first incubator chicks when but a few days old, began to die by the dozens with White Diarrhea. I tried different remedies and was about discouraged with the chicken business. Finally, I sent to the Walker Remedy Co., Dept. 438, Waterloo, Ia., for a \$1.00 box of their 'Walso White Diarrhea Remedy'. It's just the only thing for this terrible disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."—Mrs. Ethel Rhoades, Shenandoah, Iowa.

Cause of White Diarrhea

White Diarrhea is caused by the Bacillus Bacterium Pullorum. This germ is transmitted to the baby chick through the yolk of the newly hatched egg. Readers are warned to beware of White Diarrhea. Don't wait until it kills half your chicks. Take the "stitch in time that saves nine." Remember, there is scarcely a hatch without some infected chicks. Don't let these few infect your entire flock. Prevent it. Give Walso in all drinking water for the first two weeks and you won't lose one chick where you lost hundreds before. These letters prove it:

Never Lost a Single Chick

Mrs. L. L. Tam, Burnetts Creek, Ind., writes: "I have lost my share of chicks from White Diarrhea. Finally I sent for two packages of Walso. I raised over 500 chicks and I never lost a single chick from White Diarrhea. Walso not only prevents White Diarrhea, but it gives the chicks strength and vigor; they develop quicker and feather earlier."

Never Lost One After First Dose

Mrs. C. M. Bradshaw writes: "I used to lose a great many chicks from White Diarrhea, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 438, Waterloo, Iowa, for their Walso White Diarrhea Remedy. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after giving the medicine and my chickens are larger and healthier than ever before. I have found this company thoroughly reliable and always get the remedy by return mail."—Mrs. C. M. Bradshaw, Beaconsfield, Iowa.

You Run No Risk

We will send Walso White Diarrhea Remedy entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is for White Diarrhea in baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for package of Walso (or \$1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Leavitt & Johnson National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

WALKER REMEDY CO., Dept. 438.

Send me the () 50c regular size (or () \$1 economical large size) package of Walso White Diarrhea Remedy to try at your risk. Send it on your positive guarantee to promptly refund my money if not satisfied in every way. I am enclosing 50c (or \$1.00). (P. O. money order, check or currency acceptable.)

The Problem of Marketing Eggs: What Cities Want

L. H. HISCOCK

THE farm egg and its sale presents a problem at this time of year. The market price is falling or attaining rock bottom; the hens laying eggs by the dozens, and the big question is what to do with them all? Eat them, put them in water glass, trade them in at the town stores, and still there are apt to be eggs left over. And, if you are going to sell the few left-overs outright, the chances are that

L. H. Hiscock

you would have been better off if you had sold them all to begin with, barring those that you used on your own table.

There are various ways of disposing of eggs; these ways are all dependent on fresh, clean, well graded eggs. If your farm is on a state road, the chances of building up a profitable business by advertising is yours. If you satisfy your customers by giving good quality, your fame will spread rapidly.

Unfortunately, not all of us live on a well traveled, state road. If we are near a large city that has a curb market, we may find it profitable to go into town with a load of farm products including eggs from time to time. If our time is more limited, our only chance to dispose of eggs is by trading them in at the country stores or by selling them to distant commission men in crate lots. Of two evils, it is better to sell to a commission man than to swap your eggs in, because the man you make the swap with has got to sell to the commission man himself, and he, therefore, allows you less than a commission man might. In other words, the town storekeeper has to protect himself and be positive that what he allows you does not exceed what he can actually get for those eggs himself. To do this he must leave a margin in his favor, not yours, and it is only justice that, for the work he does, he should receive compensation.

New York a Hard Market to Satisfy

This brings us right down to the wholesale disposal of eggs. There are commission men in all cities of any size buying and selling eggs, but it is often thought that, if the eggs are shipped to New York, the price returned for the case cannot help but be good. From personal experience, from the personal experience of others, and from commission men's comments, New York City is one of the hardest places in the whole world without any exception to get a good price for a farm egg, unless you can meet the exact wants of their market. To express the New York wants as concisely as possible (I always worry for fear I may leave out one or two specifications) New York wants a fresh, well graded or sorted line of eggs, white being the preference. These eggs must be clean, unwashed, infertile, sound shelled, pale or light yolk. If you have both brown and white eggs, they must be divided so that they can be easily separated.

A Comparison with Other Cities

To fall down on any or several of these New York demands is to lose the best price. You cannot kid a commission man; he examines those eggs for these points and he knows if any of them are missing. Hence, the difficulty of getting a good price in New York.

It is unquestionable true that the average best price in New York exceeds the same average best price in any other city of the state. But, at the same time, it is well to remember that few of the other cities have so many specifications to meet, and, for this reason, a smaller city may be a more logical outlet for your egg supply.

(Continued on page 374)

Do you raise 92% of your Chicks?

Amazing results secured by adding
Dry Yeast to the regular feed
... losses drop to 8¼ per cent

OUT OF 1491 CHICKS put into the brooders, 1368 were raised to the broiler stage—that is the record made with Fleischmann's Pure Dry Yeast in mid-winter, the hardest season of the year! Mortality was only 8¼ per cent—less than half the usual loss that experienced poultrymen have come to expect!

FLEISCHMANN'S Pure Dry Yeast not only cuts down the mortality among chicks that are raised on a ration with Dry Yeast in it, but the benefits of Dry Yeast when fed to breeding stock are transmitted to the baby chicks through the eggs.

Other tests conclusive

This brooder test was one of many being made with Dry Yeast. Another test was made by Harry R. Lewis, former Professor of Poultry Husbandry, New Jersey Agricultural Experiment Stations, one of the country's foremost poultry authorities and a successful commercial poultryman. It proved that the mortality among chicks from Yeast-fed breeders was only 5.4 per cent up to three weeks of age—the most difficult period in handling chicks. The mortality among chicks from breeders not fed Yeast was 12.8 per cent—more than double the mortality rate of the others!

These results are amazing—but the explanation is simple.

How Yeast acts on feed

As soon as Dry Yeast, dissolved in water or milk, is added to the feed, it begins at once to ferment. (When fed in a dry mash, Yeast acts on the feed as soon as it is eaten.) It acts upon the

feed in a way similar to digestion itself, breaking down the food elements of the mash (which must be broken down before they can be completely digested) and making them ready for easy, rapid absorption.

This better assimilation is reflected in turn by healthier, more vigorous birds. Growth is speeded up also by the addition of Vitamin-B, the vitamin of growth, which is found in Dry Yeast in its most concentrated form. And the mild laxative value of Dry Yeast keeps chicks extremely free from digestive disorders which usually cause heavy losses in ordinary brooding operations.

A complete report on the use of Fleischmann's Pure Dry Yeast for cutting down mortality and speeding up growth has been prepared. Send for a copy—it's free.

Fleischmann's Pure Dry Yeast can be bought in 1 lb. or 2½ lb. packages, 25 lb. cartons, or 100 lb. barrels. It will keep indefinitely. Full directions in every container.

NOW—this trial package for \$1

So you can thoroughly test for yourself the amazing results of Fleischmann's Pure Dry Yeast, a special trial package is now ready. One dollar brings it to you. Enough to last 100 adult birds for over 4 weeks—the cost is less than 1c per bird per month! Your dealer should be able to supply you. If not, order direct from us. Transportation charges prepaid. Send today—enclose check, cash, or money order with the coupon below (\$1.20 in Canada, Cuba, Porto Rico and other countries). The Fleischmann Company, 69 Bank Street, New York, N. Y.

Reviewing the Latest Eastern Markets and Prices

MILK PRICES

THE Dairymen's League Cooperative Association announces the following prices that dealers will pay the League during the last half of March for milk testing 3% in the basic zone of 201 to 210 miles of New York City. It is understood of course that the prices mentioned below are not received by the farmer but go into the pool. They are prices dealers pay the League.

The reduction in Class 1 amounts to 27 cents per hundred while in Class 2 the reduction is 10 cents per hundred in each class, A, B, and C. Class 3 prices remain the same as in early March.

It is reported that the Directors have voted that these new prices for the last half of March will be continued in April unless conditions warrant further change.

Class 1 Fluid Milk\$2.80
Class 2A Fluid Cream 2.10
Class 2B Ice Cream 2.15
Class 2C Soft Cheese 2.05
Class 3A Evaporated whole milk

Cond. whole milk 1.90
Class 3B Whole milk powder 1.85
Class 3C Hard cheese other than

American 1.65
Class 4 prices will be based on butter and American cheese quotations on the New York market.

Sheffield Producers

The Sheffield Farms Producers announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1\$2.80
Class 2 2.10
Class 3 1.65

Class 4 prices determined by butter and cheese quotations on the New York market.

Non Pool Cooperative

The Non-Pooling Dairymen's Cooperative announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1\$2.80
Class 2 2.20
Class 3A 1.80
Class 3B 1.75

Interstate Producers

The Interstate Milk Producers Association (Philadelphia Price Plan), announce the receiving station prices or the price to the farmer in the 201 to 210-mile zone from Philadelphia for 3% milk is \$2.19. In the 101 to 110 mile-zone, the price is \$2.29.

BUTTER HAS SLIGHT RELAPSE

The butter market had a slight relapse since our last report, but it was not unexpected. The situation was such that any increase in arrivals would have caused a slight recession in prices. That is exactly what happened. In our report last week it was stated that we could not see how any advance could be expected in view of arrivals from Canada and New Zealand in addition to our home make. These added to the heavy storage supplies do not permit of much

of an advance. As we go to press the situation is unchanged. Prices have receded to 48¾ for marks scoring higher than extras. Extras (92 score) are worth 47¾ while other grades of creamery vary from 35 to 47¼c.

The immediate outlook is brighter. Although 92 score butter is selling for 47¾c and receivers are meeting the demand promptly, and buyers are not as snappy as they were and are only taking on their immediate requirements, nevertheless the situation is such that in some quarters there is a little disposition to ask a fraction more. We would not be surprised to see the market back to 50c for 93 score before many days. The outlook is better. Advances from producing sections indicate that there will be no immediate heavy increase in the make. Less Canadian butter is rolling and reports have it on good authority that no more New Zealand butter will arrive this season. The "make" in the Argentine is short. On top of that withdrawals from storage are very heavy. The statistical position therefore is steadily improving. Whether that will have any immediate bearing on prices remains to be seen but the stage is well set. We do not look for any big price advance but if the market can only hold its own around 50c, it is going to be a lot better than many thought last fall.

WHITE HELD CHEESE SCARCE

The cheese market continues in its firm tone and even to the extent of a very slight price increase over last week. Fancy held whole milk State flats are now quoted at 26½ to 27c on both white and colored. Average run held goods are bringing from 25½ to 26c for white and from 25 to 26c on colored. In other words, average run goods are a little higher than they were last week and it is not beyond the range of possibility to expect an increase on white cheese, especially since that line is becoming increasingly scarcer. The arrivals of fresh cheese are comparatively light and these are being chiefly taken at 24½c.

EGG MARKET UNSETTLED

The egg market for the moment is up in the air. Trading has been fairly active and clearances have been satisfactory. Not a great deal of storage is being done due to the fact that prices are considered too high to warrant storage.

Of late receipts have been falling behind those of last year, and have had the tendency to keep prices comparatively firm. During the last few days, however, arrivals have increased materially and advices from the west indicate freer movement of stocks this way. This immediately meant an easier tone on the leading grades and was responsible for the market taking on an unsettled tone. When advices of this kind are received, buyers are reluctant to take on stocks until they see which way the market is going. The demand is not what it should be, especially on closer selections and we may see a little accumulation which added to these freer arrivals will undoubtedly cause a lower market.

Nearby whites have been clearing fairly well but they are becoming more plentiful. Comparatively few nearbys will fall in the grade of extras. These fancier marks are worth from 37 to 39c, but the majority of the stock is turning at 32½ to 34c. Gathered whites are worth from 31 to 35.

In view of the foregoing facts we question the advisability of farmers shipping eggs to New York, if they can get a satisfactory price at home, comparatively speaking, especially if the home trade is not as particular about size and color, or in other words, grading. One of the main kicks with nearbys today is the fact that so many off-colors are coming in as chalk white. If a man can sell his entire output locally at a straight figure that is anywhere near the New York price at all, he will save a lot of bother and worry, especially when he considers the factor of breakage and express added to the problems he must face when he ships to New York. If country prices fall severely during the next week then it will pay no doubt, to go back to close selecting and ship to the discriminating trade. Ordinarily the New York market is a "paying" market, but right now

country prices are on a par with the metropolis where average stock is concerned.

LIVE POULTRY HIGHER

The live poultry market has gone higher since our last report and the chances are it is going to stay there for a few days, that is on fowls especially. Roosters are dull, which is usually the case just before the Jewish holiday, Passover. This holiday comes on April 12. The best market days will be April 9 and 10. The commodities most in demand are live turkeys, fat fowls, ducks and geese. Those contemplating selling on this market should so "time" their shipments that they will arrive not later than Friday noon, April 10. Saturday undoubtedly, will be a dull day due to heavy late arrivals. It may be better to get them in on Thursday.

Express fowls have been in rather light supply, especially fancy heavy stock, which is receiving the chief call. These are worth from 30 to 33c while Leghorns are bringing 28c. Chickens have got to be extremely fancy to bring 40c. Roosters are very dull. Spring broilers are as high as 60c for fancy stock. Capons are worth anywhere from 50 to 55c, while "slips" are worth 35c. Nearby ducks are bringing from 24 to 26c and turkeys 40 to 45c. These latter may improve before the week is up.

OLD POTATOS DRAGGING HEAVILY

The old potato market is a pretty discouraging affair as we have been saying for the past several weeks. There is no use fooling ourselves into thinking it is better than it is or that it should be better. Here is an instance that happened only a few days ago. A car of Vermonts arrived and were sold at \$1.10 a cwt delivered. On inspection by the buyer he found here and there a rotten potato. At the outside there may have been 300 pounds of wastage, not enough to argue over under ordinary conditions. These few potatoes constituted only a slight defect but the purchaser put up such a fearful howl backed up with a threat to return the potatoes unless adjustments were made. An adjustment was made by cutting the price a few cents per hundred. Had the man who was selling these potatoes failed to do this he would have had a car of stock on hand that would be hard to sell. And a car of potatoes is hard to sell in a market that has more than it wants. When a defect is apparent that would ordinarily be considered minor, the purchaser today makes a mountain out of a mole hill. The market is in his favor. If the receiver refuses to make an adjustment and takes the potatoes back and before the car can be sold a second time, demurrage charges have eaten up more than the amount of the adjustment.

The men in the market are watching demurrage charges more than anything right now for it does not take long to run up a nice little expense bill against the car. On March 25 States were bringing \$1.50 per 150 pound sack delivered in New York City. Maines are worth 10 to 25c more. Even some Long Island potatoes are beginning to meet opposition at current prices. Where a little sponginess is noted it is magnified to the point that prices are facing a weakening condition. Those fellows who have held a lot of potatoes with the hope of high prices at the end of the season face a serious situation. Had they released their stock steadily during the marketing season they would have been much better off. As it is now, chain stores are beginning to turn more to southern potatoes even at advanced prices. Consumers are demanding new potatoes and when they are willing to pay for them the stores give them what they want. That is to be expected. Incidentally it strikes us that the potato men must get together and institute an advertising campaign to combat some of the work that is being done by spaghetti and macaroni manufacturers. The slogan "a pleasant change from potatoes" is not doing the potato business any good and the potato men have got to get busy or a lot of business is going to slip through their fingers.

HAY SLIGHTLY BETTER

The hay market is improved slightly over last week, the top grades advancing

to \$26 a ton. Receipts have been moderately light right along which accounts for the steady condition of the market. The demand is good for top grades but there is enough hay in the market to warrant a dollar differential according to size of bale. The fanciest timothy is worth \$25 in small bales and \$26 in large. Light clover mixed is bringing \$23 to 24 for No. 1; No. 2 is \$20 to 21; No. 3, \$17 to 18. Second cutting alfalfa has gone back to \$31 although small bales have been averaging around \$29; No. 2, \$25 to 26; No. 3, \$23 to 24. Oats straw is worth from \$14 to 15 and No. 1 rye \$15 to 16.

BEANS STILL DULL

There has been no change in the bean market, no improvement and some weaker trend, especially in pea beans. These are being offered liberally at \$6.50 but very few are being taken. Most of the business is going on from \$6 to \$6.25. Red kidneys have also started to feel the weaker market and common stock is around \$9.75, although most of the business is being done at \$10. Real choice stock is worth \$10.25. White kidneys have been having a hard going at \$8.50 to \$9. A few real fanciest have brought a slight premium. Marrows are still worth from \$9 to 10.

GRAINS AND FEEDS

The wheat market has been up and down since our last report. May wheat closed on March 24 at \$1.65¼. This is some improvement over last week's report, but the market is rather unsettled. Poor crop reports are becoming numerous, while foreign advices have been having a weakening influence. The "future" trade has been giving a great deal of attention to the situation at home, especially the winter wheat belt. There has been little or no rain over the entire area. Moisture is badly needed in many sections and according to reports, unless this comes soon heavy damage will occur. Some relief has been reported in the southwest.

Cash Grains

Following prices are quoted for March 24, F. O. B. New York City: WHEAT No. 2 red, \$1.85 to \$1.90; No. 2 hard winter, \$1.79¾; No. 2 mixed durum, \$1.81¼. CORN, No. 2 yellow \$1.30 to \$1.33; No. 2 mixed \$1.29. OATS, fancy white clipped 58½ to 60½; ordinary white clipped 55½ to 56½c; No. 2 white, 55 to 55c. RYE, \$1.33 to 1.35. BUCKWHEAT, sound milling, \$2.25 to 2.30 per hundred.

Local Buffalo Feed Market

No. 2 yellow corn \$1.21; ground oats \$37 per ton; spring wheat bran \$24; hard wheat bran \$30; standard middlings \$25; soft wheat middlings \$36; flour middlings \$34; red dog flour, \$41; white hominy \$39, yellow hominy \$39; gluten feed \$37.75; gluten meal \$48.50; 36% cotton seed meal \$40; 41%, \$42; 43%, \$44; No. 4 percent old process oil meal \$39.

MEATS AND LIVE STOCK

The demand for live calves is good and the market is maintaining a fairly steady tone. Receipts have a lot to do with the way the market goes up and down. Some stock has been coming in none too good condition and as a result has been shaded considerably. \$15.50 represents the top of the market with values ranging all the way from \$7 upward depending on quality. Lambs, considering quality, are meeting a fairly steady market although a lot of stock arriving is very common. Primes are selling around \$16.60 to 16.75. Fair to good stock is worth from \$13 to 15, culls running as low as \$9. Ewes have got to be fancy to bring \$8. Hog prices are holding up fairly well, although the market is irregular. Yorkers weighing in the neighborhood of 200 pounds are worth anywhere from \$13.25 to 14.25 per hundred.

Country dressed veal has been more or less quiet. Receipts have not been heavy and the situation has been rather firm. The Department of Health of late has condemned many calves which were not properly dressed and not clean, also a lot of calves have been country dressed that are too small for legal sale. In some cases where the calves have been in interstate traffic, the Department turned the matter over to Federal authorities for prosecution.

New York Farm News

Western County Notes by M. C. Burritt

A walk out through the orchard today stirred up anticipations of plowing in March. The high winds and warm sun of the past week dried up the mud surprisingly. The frost is all out of the ground now and the tile are beginning to function again. One can tell the minute he steps over or near a line of tile, by the firmness of the soil and its more open texture, that these silent hidden agents are doing their duty well. The problem now is to get the brush out of the orchard so that we can plow. Of course, rain may come again any day and set ahead our present expectations of an early spring.

I like to get the plows started in the orchards first and get cultivation started as early as possible so as to have the nitrate available when they may be needed. I am sure that much orchard cultivation is more or less wasted because it is started so late. Plowing is so often delayed in the spring, that it is good orchard practice to plow in the fall whenever conditions permit. But not to get the plows and harrows started until blossoms and leaves are out is to lose a large part of the opportunity to promote nitrate availability. And nitrates not only promote tree growth but recent studies show that they have much to do with blossom development and fruit set.

Plowing More Desirable Than Discing

In these days of tractors and heavy efficient disc harrows there is a tendency to let the plowing go all together and depend on the disc harrow. I don't like it. The ground becomes too hard and compact at a depth of only three or four inches and the tree roots come up close to the surface. There is more chance of root injury. Moreover, plowing turns under most of the leaves and rotten apples, etc., and by that much reduces the chances of scab infection and no doubt destroys some insects that winter in the rubbish on the ground. So I'm for a shallow spring plowing this season even if it does take more time and cost more than discing.

Peach Leaf Curl Too Much Neglected

Another job that ought to be done in the fall but very often doesn't get done, then is the spraying of peaches for leaf curl. Of late this peach leaf disease has caused a great deal of damage. There are two peach orchards in sight of my house that have been several times defoliated and as a result are practically ruined. Control is relatively simple requiring only one spraying with lime sulphur, seven gallons in water to make 100 gallons. But the application must be made while the buds are dormant, either late in the fall or very early in spring before they start. The great advantages of fall spraying are that it takes the work out of the rush of early spring, and that the ground is firmer. In spring it frequently happens that the mud is so bad that we can go into the orchard with only half a tank at a time.

Farm Markets in Slump

Farm markets are very much in the dumps again. With the warm weather in March and the promise of an early spring, a good deal of produce has been put on the market, and consumption is apparently dragging with consequent low prices. Potatoes are bringing only 35 cents a bushel on the Rochester market now with sales slow at that. Carrots are a drug on the market. One man here has two carloads that he can't even get an offer on. Cabbage meets with little demand even at \$10 to \$12 a ton. Warm weather has so slowed up the apple market that comparatively few cars have been moved and these at lower prices. Eggs are holding up pretty well at 30 to 35 cents a dozen in spite of the heavy increase

in production—which warm weather has brought on.—M. C. Burritt

Dairymen's League Annual Meeting, June 18

THE Dairymen's League Cooperative Association announces that the 1925 annual meeting will be held on June 18 in New York City. This is the first time since the organization of the pool that the annual meeting will be held in the Metropolis. Even since 1921 the annual meeting has been held in the State Armory in Utica. Previous to that time the annual meeting of the Dairymen's League were held in Jersey City.

New York was decided upon, according to the League, after a very careful survey was made of the membership to determine the 1925 meeting place. There are certain advantages in that the delegates will have an opportunity to see the League offices and to get some first hand knowledge of the milk market situation in the greater city.

There has been a growing sentiment of late years among the membership that the annual meeting should be held in different parts of the League territory. However, the choice of a city is limited due to the fact that few cities have a meeting place that is large enough and have hotel facilities to take care of the large number of delegates that attend this annual convention.

Seneca County Sheep Men Meet

THE annual meeting of the Seneca County Sheep Growers Cooperative Association, Inc., held its annual meeting at Romulus, March 18th. It was an all day meeting. In the forenoon President Gilbert D. Townsend in the chair, a general discussion was entered into, including problems of sheep husbandry, diseases, comparison in profitability with dairying and whether or not it is advisable or not to pay \$20 for breeding ewes.

At noon a lunch was served with Secretary Arthur H. Brooks as chef. The line up of sheepmen at the table spoke well for the quality of men engaged in sheep raising in Seneca County. After lunch a few jokes were indulged in, a few visitors introduced and the new county agent was called upon for a few remarks which were well received. The afternoon session of the meeting consisted of three talks. Professor W. T. Grams from Cornell on Factors entering into Successful Sheep husbandry, Mark J. Smith on the A B & C of Sheep Husbandry and F. E. Robertson discussed the work of successful cooperative wool marketing in New York State.

In the North Country

Jefferson County—Frost is rapidly coming out of the ground. The snow is about all gone. Some sugaring is being done but as yet sap is not running very well.

Many farms are changing hands and auctions are much in evidence. Fred Lingnelter has purchased the William Tozer homestead on the outskirts of Evans Mills.

Farmers are becoming more enthusiastic over poultry since eggs brought such a good price during the winter. When 10 dozen eggs bring \$8 it looks good to the man in the family when poultry is considered the woman's job.

Veal is holding up well in price, bringing from 11 to 13c. Cows range in price from \$50 to \$100. Pork is going higher in price all the time and is 16c dressed now. Much hay remains in the hands of farmers. Buyers are not handling much and the price is not very promising, varying from \$10 to \$13 for the very best. A few have sold loose hay for \$13 to be fed locally.

—Mrs. C. J. Duxtater.

"Get the Orchestra from the City"

Popular Price
Neutrodyne Receiver

The Eagle five tube receiver, and the popular priced three tube EAGLET are delighting rural residents in all sections of the country as only neutrodyne receivers can.

The EAGLE Receiver
Model B 5 Tubes \$175

For distance, selectivity, sturdiness and easy operation, this receiver is a favorite. Remarkable range for a receiver at so low a price. Inexpensive to install and to operate.

The EAGLET

3 Tube
Dry Cell Operated \$75

employs regular neutrodyne reception, has a surprising range, and as it uses dry batteries, requires no carting away of storage batteries for recharging. Extraordinary value at \$75.

New Jersey Farm News

Growers and Nurserymen Meet

In an effort to develop a plan which will create better business practices in the sale of nursery stock, the New Jersey Federation of County Boards of Agriculture in co-operation with the organized fruit interests of the State, called a conference of fruit growers and nurserymen at Trenton, N. J., this week. The conference followed an effort this year—later dropped at the approval of both fruit growers and nurserymen—to pass a law which would compel fruit tree interests to deliver what they claim they are selling. Farm Bureau and horticultural leaders in New Jersey expect the meeting will ultimately result in the establishing of a definite code of practice in the sale of nursery stock, satisfactory to both growers and nurserymen.

Big Year for Poultrymen

All indications point to a busy poultry season in central and southern New Jersey. Commercial hatcheries have been under way for some weeks and with an early Spring anticipated, poultrymen and farmers are starting their incubators early in the season. The European fowl pest this last season has caused some apprehension among poultrymen in New Jersey, but with the situation well in hand and infected sections now practically under control the agitation has largely died down. Chick hatcheries in Huntington County, in the Frenchtown section which is one of the largest baby chick areas in the country, have been at capacity operation for nearly two months.

Canneries Getting Ready

In southern New Jersey the canneries are already laying plans for the coming season's pack of tomatoes, peas, beans and similar vegetables. Growers are showing considerable reticence in committing themselves to future contracts, it being reported that the canner's offers of \$22 per ton for 1925 tomatoes are not being accepted. In Salem County farmers generally refuse to tie up their acreage of can house tomatoes, awaiting not only the development of the season but the possibility of renewing plans for organization of canhouse growers in New Jersey to consider better methods of business. Apparently, the pepper acreage in Gloucester County will be fairly large this coming season.

Potato Marketing Still a Problem

Interest is still keen in central New Jersey on ways and means to market the 1925 potato crop. Co-operative methods in Manmouth County have not brought the expected results to growers and although effort may be made to this end during the coming season, plans are now going forward for the improvement of marketing conditions by joint effort with the dealers in this central New Jersey territory. As an outgrowth of the State Potato Improvement Committee, a dealers' committee is now functioning to encourage dealers to refuse field run of potatoes, to follow closely with government grades in the standardization of the pack and to work with producers for more uniform grading and packing of the tubers. A good many dealers in the potato districts have joined in the move.

Additional New Jersey Farm Notes

D. T. HENDRICKSON

THOMAS LUTES of Upper Freehold was given first prize for his six suggestions for the 1925 program of calf club meetings. His suggestions touched on the following: (1) Feeding, (2) Breeding, (3) Milk Testing, (4) A Debate—Gurnseys vs. Holsteins, (5) Fitting for Show, (6) Tour.

Fruit growers have failed in their efforts to get redress for the damage done to young fruit trees by the large number of rabbits that have been distributed throughout the State by the State Game Association.

The only means for fighting this pest seems to be to put closely woven wire around the trunk of the tree to a height of at least two feet.

* * *

The Middlesex county potato improvement committee for the ensuing year is composed of the following: George Davison, Clifford A. Stults, Harvey H. Dey, Arthur A. Clayton, Grover Stults, S. E. Bennett and H. J. Butcher. This committee, whose successful efforts in getting the growers last year to spray with Bordeaux mixture resulted in an average increase in sale of about \$400 per grower, makes the following timely suggestions:

1—That only certified or high grade seed be planted.

2—All seed should be treated by soaking in a solution of corrosive sublimate to help control potato scab and rhizectonia.

3—The crop should be planted only on land free from scab and known to be adapted to potatoes.

4—Potato growers should support all efforts on the part of the distributors or any other agencies to improve the equality and grade of the potatoes shipped out of Central New Jersey.

* * *

Tomato growers have their seed beds well under way. Large quantities of this vegetable will, as usual, be grown this year for sale in nearby urban markets and several farmers will also grow it for the canners and soup makers. The only drawback to this latter phase is the high freight rates. Last year, from statistics taken from 36 farms, the yield was under 8 tons per acre, while in a few instances it ran up to 16 tons per acre. The average, when grown for market, is about 300 crates per acre. Local canneries are contracting now for tomatoes at \$18 per ton delivered.

* * *

The Japanese beetle has come into Monmouth county and half of the county is now under quarantine to check its advance. Two years ago, Rev. F. H. Shermer of Middletown brought home some of the beetles from South Jersey. He fastened them to a board with a pin and they lived for two weeks in this condition. It is no wonder that sprays and poisons are unavailable against the beetle!

SWINE BREEDERS

Feeding Pigs For Sale

Yorkshire and Chester cross and Chester and Berkshire cross, all large growthy pigs. Pigs 7 weeks old \$6 each, and 7 to 8 weeks old \$6.50 each. All bred to make large hogs. I will ship from one to fifty C. O. D. No charge for crating. I guarantee safe delivery.

WALTER LUX,

388 Salem St.

Telephone 0086

Woburn, Mass.

75 Chester and Yorkshire pigs Crossed, 6 to 7 weeks old \$6.50 each. 8 weeks old \$7 each. Will ship any of the above lot C.O.D. on approval. If not satisfied when you receive them, return them at my expense.

MICHAEL LUX, Woburn, Mass.

Klutch holds False Teeth tight

Klutch forms an adhesive cushion between the plate and gums; holds the plate so snug that it can't rock, can't drop, can't chafe, can't be "played with" and not a seed can get under it. You can eat, talk, laugh or sing just as well as you ever did with your natural teeth. A box of Klutch is three months of joy. Postpaid 60cts; 2 boxes \$1.00. (Send \$1 bill at our risk). Use a whole box. If not more than satisfied, all your money back.

HART & CO., Box 5021 Elmira, N.Y.

THE week ending March 14, saw the first general farm activity start in our section of the island (eastern end of Nassau). Several farmers have their plowing well under way for potatoes and inside of the next two weeks things will be humming. For the past week farmers have been busy hauling fertilizer from the cars. Those who have been fortunate enough to get manure have been hauling that and spreading it. Stable manure from New York City is not as plentiful as it was years ago and farmers have a hard job figuring how to keep up the humus in the soil. Several years ago when the Farm Bureau started talking about growing rye for organic matter, many farmers were inclined to laugh the matter off. The time has come when most of them get rye in just as soon as the potatoes come out in the fall.

As far as the Island is concerned, it looks as though the usual acreage of potatoes will be planted this year. Some fellows will have a hard time getting credit for fertilizer and this may cut the amount planted slightly. Year in and year out, though, the acreage is about the same.

* * *

Island Farmers Hard Hit

Up-State farmers are not the only ones that are hard hit this year. Farmers around the east end of Nassau County and the west end of Suffolk County are hard pressed by market conditions. Last fall thousands of barrels of long beets or "sheeny" beets were put in pits and trenches. The rush of the fall season made it impossible to haul these to market. At that time they were selling for \$1.25 per barrel, not a bad price. Today they hardly bring 25c a barrel, not enough to pay for the cost of taking them out of the pits. The same holds true with Savoy cabbage. Farmers down here cannot get a cent a head for their stuff and yet when you go to the stores less than four or five miles away, you have got to pay all kinds of prices. Not long ago I was in Hempstead and stopped in to buy a head of cabbage. The fruit and vegetable man (they are mostly all foreigners down here) wanted something like 6c a pound. That meant \$120 per ton. I told him that was an awful price but he said the crop was short. I offered to get him any number of carloads he wanted for \$20 a ton. He simply shrugged his shoulders and said nothing. I didn't buy any cabbage. That is the way it goes. Even the roadside stands are getting that habit. Very few of the roadside stand proprietors grow the produce they sell and they charge outrageous prices. They are really spoiling the game for those farmers who are trying to sell some of their surplus at a price that is right.

* * *

Potato Men Up Against It

Our Long Island growers also got a pretty tough deal on potatoes this year. They got more than upstate growers, but when you figure the amount of money that Long Island farmers spend for fertilizer, seed and labor to say nothing of taxes, they have got to get high prices to break even. A man who grows 100 acres of potatoes down here sinks a young fortune in the ground before he get one dollar out of it.

A gradual change is coming over Nassau County. There are more small truck crops grown than years ago. Real estate developments have rapidly driven the garden farmers out of the east end of Queens County and they have been compelled to work farther east where land is not so expensive, although a man who wants to buy a farm today has got to pay at least one thousand dollars an acre. It seems any land today can be considered to have real estate possibilities. Since the garden farmers are using motor trucks their distance from markets is not quite as serious as it was years ago when they had to use horses and when roads could not compare to our present day State roads. And with the automobile, suburban

dwellers and city workers do not necessarily have to live right in the villages.
—W. F., New York.

* * *

Suffolk County Notes

Farmers are selling potatoes for 70c a bushel. Brussels Sprouts are bringing 20c a quart; hay is selling from \$30 to \$35 per ton and straw around \$28. Plowing has started and everyone is looking forward to a big year.—F. L. S.

* * *

Potato Growers Oppose Increase in Potato Acreage

Recent releases from the Bureau of Agricultural Economics of the U. S. Department of Agriculture relative to a larger potato acreage for 1925 has not met with favor in Suffolk County. The following resolutions were sent to H. C. Taylor, Chief of the Bureau, by the Executive Committee of the Suffolk County Farm Bureau, over the signature of J. C. Corwith, its president:

"Whereas potato production has been ample or excessive during the past five years, and whereas excessive production has caused heavy losses to potato producers in much of the U. S. and,

Whereas the increased acre yields are due to improved seed and improved methods are likely to result in increased average yields permanently,

Be it resolved by the Executive Committee of the Suffolk County Farm Bureau that the recommendation of the U. S. Dept. of Agriculture tending to favor an increase in potato acreage for 1925 is opposed to the best interests of potato growers, and,

Be it further resolved that the said recommendation is obviously mistaken and should be promptly retracted, and full publicity be given to such retraction.

It is further resolved that copies of this resolution be sent to the U. S. Department of Agriculture, to the American Farm Bureau Federation, to the N. Y. State Farm Bureau Federation, to the AMERICAN AGRICULTURIST and to the Rural New Yorker."

Riverside Oversize Cord Tires and TUBES

You Can't Buy Better Quality So Why Pay More?

We want to sell you a Riverside Tire on the basis of high quality. We say to you that a Riverside Tire will do *all* any other tire can do. They are guaranteed to run 10,000 miles on your car. They often go 18,000 miles. What more can any other tire do? So why pay more?

Built to Our Order To Equal the Best

Satisfactory service and long mileage are built into Riverside Tires at the factory under our supervision. They cost as much to make, contain as much or more good live rubber, just as strong fabric, and are as carefully made and inspected as any tire regardless of price.

Compare Riverside Tires Only with the Best Standard Tires

Riverside Tires are not to be compared for a moment with tires made lighter and smaller on purpose to sell for a little less or a little more than our tires. They are to be compared only with the best standard makes of superior quality.

Riversides are the safe tires for you to use. Big heavy blocks of live rubber and extra thick side studs and husky ribs grab the slippery roads and are your greatest protection against skidding.

Order at Our Risk

Our 53-year old guarantee protects you. Your money back if you are not satisfied. If you have not received your copy of our Auto Supply Catalogue, just drop us a postcard requesting one.

Please send me two more Riverside Cords. I have two that have gone 6,000 miles and they look like they had been run only 1,000 miles. Hereafter nothing but Riversides for me.

William Salo,
Cloquet, Minn.

Have used a pair of Riverside Cords for a year, over 10,000 miles, and they are still good. Other cords put on at the same time are gone.

Mr. M. A. Smith,
Sioux Falls, S.D.

I have a Riverside Tire that has been on my car three years and seven months. Two of my neighbors are now using Riversides after seeing the splendid service they gave me.

Thousands Buy Wittes On New, Easy Plan

Now Only \$5.69 a Month Puts a
Witte On Your Place—Lowest
Price In 43 Years.

Thousands of farmers all over the country are accepting the liberal offer of Ed. H. Witte, world-famous engine manufacturer, on the standard Witte Throttling-Governor Engine.

Now only \$5.69 down puts a Witte to work for you—the lowest price in history on this rugged, dependable engine. Fully equipped, with celebrated water-proof WICO Magneto and over forty new improvements—this is the greatest engine bargain ever offered. A new device makes starting easy in any temperature, even as low as 40 degrees below zero.

The Rugged, Dependable Witte

Long regarded as the cheapest and most dependable farm engine built, the WITTE develops 50% extra power on either kerosene, gasoline, distillate or gas. Operation on full load figures under 2c an hour. Trouble-proof and so simple that a boy can operate it. Easily moved from job to job. More than 150,000 WITTES are in daily use.

To introduce this remarkable engine to a million new users, Mr. Witte will send it anywhere, direct from factory, for a guaranteed 90-day test.

Every reader of this paper who is interested in doing all jobs by engine power should write today for a free copy of a remarkable new, illustrated book just issued by Mr. Witte, which explains the engine fully. You are under no obligations by writing. Just send your name, a post card will do, to the Witte Engine Works, 1804 Witte Bldg., Kansas City, Mo.; or 1804 Empire Bldg., Pittsburgh, Pa., and receive this interesting and valuable book that gives you valuable information about the application of engine power on your farm.

PROVED SWEDISH TREATMENT PREVENTS ABORTION

Famous foreign treatment quickly relieves badly infested herds. Gives amazing results in cases owners believed hopeless. Formula available for every farmer.

Complete freedom from the ravages of the terrible abortion plague is now assured every worried farmer through a famous Swedish treatment. For many years it has been used with complete success in the old country, banishing this disease from whole dairy sections literally rotten with abortion.

After great expense of time and money the formula was reproduced and given to farmers in this country. History repeated itself. Herd after herd was rid of this disease. Even cows considered hopeless were restored to health and produced fine, sturdy calves.

Saved Every Calf

Frank H. Halfman, Crown Point, Ind., is one of hundreds of grateful users, he says: "Two years ago for a period of three months I lost every calf in my herd of forty cows. All abortion remedies failed. I was desperate. I heard of your C. C. C. treatment, used it and have never lost a calf since. It completely stopped my abortion troubles."

For nine years the fame of this easily given treatment has spread from breeder to breeder. Today it is distributed on an absolute binding guarantee that it will prevent abortion; that every cow treated will deliver a normal calf or the treatment cost is refunded. Such a broad guarantee is possible only because C. C. C. is practically 100% successful.

Send No Money

Mr. John W. Froberg, who is a native of Sweden and is responsible for introducing this treatment in the U. S. A. will gladly send every farmer troubled with abortion full information about it. Don't send any money—just your name and address to Froberg Remedy Co., 14 Lincoln St., Valparaiso, Ind. Full details will be mailed you without any obligation. Read the wonderful true story of C. C. C. You will be surprised how easy it is to treat your herd, how little it costs, how quickly you get results.

NUNDA POULTRY FARM, Nunda, N. Y.

The Problem of Marketing Eggs

(Continued from page 369)

The chief demand of the upstate is a good sized egg, the fresher the better. In fact, quality is the chief factor in the price reckoning. To use an illustration; during the fall of the year in Syracuse on the local curb market, I have seen pullet eggs equal and even surpass the selling price of large eggs. The same eggs in New York City would have received a reduced price, because they were pullet eggs. But the reasoning of the buyers when analyzed was logical. They figure that old hens could only be laying a few eggs and the saving of a case took a long time. Or the other hand, it was the time for pullets to lay. Therefore, the pullet eggs were the best to buy for the money, because they were undoubtedly the fresher eggs.

Study and Compare Markets

Scarcity of eggs sets the price in any market. This makes the upstate market price steady and desirable during the fall. In the spring, when the flush market is on, eggs are below the New York market price considerably. So the reports in the paper would indicate, but, as I said earlier, it is best to see how well you can meet the New York specifications. It is not such a difficult task to check your own situation in this way. Send a case to New York and as soon as possible another to a nearby upstate commission man. The return on the two cases will give you a chance to compare notes and see where you receive the best price. I suggest this as the most plausible way to find the best wholesale market. The only thing is to check the situation in the same way every three or four weeks to keep yourself posted on any change in either one of your prospective markets.

It is a hard task to tell a man to use such and such a market; the eggs may not fit the place in question. I have tried to suggest a few of the perfectly feasible ways of getting rid of your surplus eggs. It goes without saying that you want as much as you can get for every dozen eggs you sell. Don't be bound to the town store; the automobilist, or the commission man. With a little experimenting you can determine where the best price is and that is what you want.

A Chick Educator

IN raising chicks in colony houses I have found it difficult to keep them near the house the first few days unless a fence is used. It is also hard to drive them back in the house until they learn the source of the brooder heat. The chicks are likely to huddle under the house or under the track leading from the house instead of returning to the brooder.

So I have strips of one inch mesh wire which are about thirty feet long and a foot and half high. This fine mesh wire is stiff enough without more than one or two stakes to support the wire. The chicks can not fly over or squeeze through it. The roll of wire can be quickly removed and taken to another house when one brood is ready for free range and another is just hatched.

At first one end of the wire can run down one side of the track and cut over the grass, while the other end can be returned up the other side. This keeps the chicks from crowding under the track, and it is easy to drive them up into the house with the help of a short narrow board. I

(Continued on opposite page)

RELIABLE BABY CHICKS

Produced under Supervision of Men Trained by Poultry Department, Ohio State University

R. E. FADER

When the Poultry Department of Ohio State University agreed to train and authorize men as inspectors for the Accrediting of hatcheries which come up to their standard, Mr. R. E. Fader of Norwalk Chick Hatchery immediately put his flock under such supervision. He is hatching and selling nothing but Accredited chicks. Mr. Fader has been in the poultry business 22 years and has an unusual record for success in his line of work. His flocks are carefully bred and the chicks he produces are healthy and strong. He is offering chicks from eight breeds at a fair price. The public can buy chicks from the Norwalk Chick Hatchery and feel sure that they will get honest and square treatment. Mr. Fader will send a fine illustrated catalog on request, if he is addressed at the

BABY

CHICKS

Get busy with your SPRINKLING CAN

SPRING is the time to clean up and disinfect.

Time to get busy with the sprinkling can charged with a solution of Dr. Hess Dip and Disinfectant.

Sprinkle it in the poultry-house—in the nests, roosts, floors. Spray it in the cracks and crevices to kill the mites.

Sprinkle it in the cow barns, in the pig-pens, sinks, drains and closets—wherever there is filth or a foul odor. It kills the disease germs, keeps everything everywhere, healthful and clean-smelling.

DR. HESS & CLARK, Inc.
Ashland, Ohio

DR. HESS DIP and DISINFECTANT

Blue Hen Colony Brooders

The brooders that experienced poultrymen favor because they raise a maximum number of healthier chicks at a minimum of cost and attention. 20% extra value and extra size, yet large volume of sales makes possible the low prices shown.

LANCASTER MFG. CO. 880 E. Janet Road, Lancaster, Pa.

find the use of these rolls of wire saves much time in spring, as we formerly built little yards of scrap lumber around the brooder house when the chicks were first allowed to range. The young chicks learn to jump up on boards, and hop over much sooner than they will learn to fly over where there is no top board on which they can alight.

Drinking Fountains For Chicks

THE handiest drinking fountain I have ever used for very small chicks is a soup or other small can inverted in a shallow pan made by cutting a half inch from the bottom of a large fruit can. It will leave just enough space around the small can for the water to be easily reached and not enough room for the baby chicks to get into it and get their down wet. A nail hole just enough below the level of the rim of the pan to prevent running over will keep the water at the same level until the can has been emptied. For larger chicks I use a syrup bucket inverted in a large pie pan, and for a large flock of hens a small dish pan and a milk can inverted works excellently. It is best to provide a post to which the milk can may be anchored to prevent its toppling over.—L. H. COBB.

Treating Chicken Pox

I have several chickens that have a growth on top and side of the head resembling a large seed wart. Could you tell me the cause of this and if there is a cure for same. Would they effect the entire body, making the chickens unfit to eat? Would you advise killing all the chickens so affected to protect the rest of the flock?—T. S. W., Delaware.

UNDOUBTEDLY your chickens are suffering from chicken pox. The symptoms of this disease, which is infectious, consists of small scabby wart-like growth and eruptions on the head, especially on the combs and wattles and around the eyes.

In bad cases the outbreaks extend to the eyelids and even into the mouth. It is not definitely known just what causes chicken pox. It is known that it is contagious and that it will spread from one bird to another. The contagion spreads through the roosts. Some believe that the vermin attacking poultry will even carry it from one bird to another. It is known that it spreads rapidly where dampness prevails. Leaky roofs permit the entrance of air into the house and the consequent moistening of the droppings, which help improve the condition under which the disease develops. For this reason, it is believed that the disease is in the nature of a vermin. Bacteria are more numerous on the other hand than under dry conditions and it is also a known fact that the disease is more prevalent under late hatching chicks.

No Definite Cure

There is no definite curative treatment as far as internal applications are concerned. All authorities seem to agree that the application of strong disinfectants to the affected parts are most desirable. Of course, the fowls should be isolated. The scabs should be removed with a blunt instrument and tincture of iodine first applied to the sores. Creolin 2 per cent or other similar disinfectants may be used instead of the iodine. Some have used sulphur

FAIRHOLM POULTRY YARDS, William Cole, Fremont, N. H.

ointment twice a day on the nodules with good results, while others have used carbolic ointment or glycerin, containing 2 per cent of carbolic acid.

Another recommended treatment consists in bathing the affected parts to soften the crusts, afterwards applying a solution of sulphate of copper.

In addition to treating the birds, the poultry house and the surrounding runs, should be thoroughly disinfected. Disinfecting the house is comparatively simple by the use of commercial disinfectants and about the best method to treat the land is to see that it gets a good thorough turning over.—W. E. FARVER.

How to Raise Ducks

We have received a number of inquiries relative to various details on the raising of ducks from the various breeds to the market of the grown duck. Farmers bulletin No. 697, published by the U. S. Department of Agriculture is a small text in itself on this subject. Any one interested in ducks in a small way should not fail to get this treatise on the subject. It may be obtained free of charge by writing the Division of publications of the U. S. Department of Agriculture, Washington, D. C.

A Successful Cooperative

(Continued from Page 359)

The four things which this association now has which should assure its continued success are:

First: Sufficient capital and surplus. From being practically without net assets in 1918 they have built up a surplus of at least \$40,000 so that their capital and surplus stands at \$50,000 now. Interest is paid on the stock every five years but the surplus which represents profit on the package charge has been voted back to the association by its members each year. The distribution of this surplus eventually will be to the shippers in proportion to the number of packages shipped. These results are due to a large extent to efficient management.

Second: Being a local association, the members have a personal and intimate contact with the association. The directors are men of their personal acquaintance; they know the manager intimately, and are in close contact with the officers of the association. At their annual meetings 250 and 300 men are usually in attendance.

Third: Volume of business voluntarily contributed. 309,000 packages the past year. All this business comes without solicitation and the area where these crops are grown is constantly increasing.

Fourth: Efficient management. The manager, Al Schillroth, known to all the members as "Al" grew up with the association. He was bookkeeper and got an insight into the business of shipping while working in that capacity. When a new manager had to be employed in 1918, Al was given a chance and he made good. In the winter time he calls on all his distributors in the different markets. Through experience he has learned the shipping game from A to Z. Backed up by a conscientious and efficient board of directors, the Association has flourished under his management. With the continued increase in the demand for vegetables, the volume of business should increase steadily; with the continuance of the policy by the members of leaving surplusses in the association, the capital should be adequately taken care of. Efficient management, which depends entirely on the human element, must be continued. The members and directors appreciate the importance of this factor and as long as they do and are able to maintain efficient management, the Erie County

1887 BABY CHIX 1925

Growers' & Shippers' Association will continue as a shining example of what farmers can do in cooperative marketing.

Grafting Plums

(Continued on Page 362)

than graft plums and the other stone fruits. The budding is done in late fall sometime during the month of September, the buds being inserted in new wood at convenient points on the tree.

Another point that should be kept in mind is that there are several different species of plums; for example, we have the European species such as Green Gage and the prunes and we have the Japanese plums such as the Burbank, Abundance and the insititias such as Damsons. The stock which you have may not be suitable for grafting the particular variety that you have in mind; that is to say, they would lack congeniality.

This, of course, could only be told after you have made the trial. Since there is not enough experimental evidence to show which varieties are congenial and which are not. Excepting for the greater care in doing the work when the tree and scions are absolutely dormant, the methods of grafting would be the same as for the others.—A. J. HEINICKE, Professor of Pomology.

The April Rush

Continued from page 237

with a good weather eye he should snatch every favorable mid-day for running the manure spreader, that he may grow 110-day silage corn—not 90-day!

And the general-purpose farmer—what of him? Will he be found in April sitting on the top bars, trying to decide whether to plow up a run-out meadow, where to plant his potatoes, or how he is going to get the money for a new pair of horses while his team idly waits. Then woe to that man's success for the year! With his farm map before him he should have plotted each crop for that year in January—and ordered the seeds and fertilizer. Any new machinery or teams or what-not should have been settled about then also, and the working capital necessary for these and other necessary items arranged for before March even, for April is a time for doers, not dreamers. "Be sure you're right—then go ahead." But in farm management, remember the "go ahead" part cannot prosper in April unless the "Be sure" end was well-cared for in previous leisure weeks.

Whenever I see a farmer doing an autumn or winter job IN APRIL, I say to myself: "Glad that man don't owe anything," feeling sure collecting from one so unthrifty would be difficult. The foreplanning man utilizes the long weeks of Indian Summer for fence, farm road and building repairs, for building new and likewise in clearing up rough fields. Through the winter he gets his firing line ready in detail, ammunition, rations, small-arms—every item lined up for the "zero hour" of April action. Even then he will have a rush of important April items, but no such welter of half-baked, un-planned jobs as the other fellow.

The Trouble Maker—By E. R. Eastman

TAYLOR had watched the other witnesses keenly and looked them direct in the eye. But when Shepherd began to talk, he bowed his head so that no one was able to see his face.

"You were opposed to the milk strike naturally?" said Winslow.

"I was."

"Was your opposition in any way active?"

"It was. Acting on orders of my company, I have worked almost night and day arguing with the farmers in an effort to get them to bring their milk back and to show them that their strike would fail."

"Have you gone farther in your efforts against this strike than was called for by the orders of your company?"

"I have," said Shepherd.

"Do you want to tell this court and this jury anything that you did in active opposition to this strike that was without authority from your company?"

"Yes, sir. I had the thought from the start if it was not for the leadership of Taylor, the strike would not succeed, particularly in this section, and if I could keep most of the patrons coming to my plant during the strike, I would stand well with the company when it was over, even if it succeeded. So I became very bitter against Taylor and his activities, and it began to get on my mind. Got so I couldn't sleep; was nearly crazy.....On the night of Friday, I had about come to the end of my rope.Seemed as though I couldn't stand it any longer....."

"A little before ten o'clock that night, I was listening in on a party telephone line, and I heard a voice warn Taylor that a gang was on its way to dump John Ball's milk in his milk house and I knew what Taylor said that he was going up there as quickly as he could to beat them to it and prevent trouble."

Not a sound could be heard in the room except the man's low-voiced monotone, as with hands gripping the arms of his chair, he went on.

"All the devils in Hell kept telling me that that was my opportunity. I jumped into my car, and drove up the Speedtown road, left the car in a little branch road and climbed over the stone wall fence to wait for Taylor to come along the main road. I had not long to wait. Soon I heard the tattoo of the hoofs of a running horse, and I knew my man was coming."

Even the dramatic moment could not keep Ann Jenkins from reaching over and trying to attract the attention of Caroline Hicks. But Caroline was not to be distracted. She could quarrel with Ann at any time, but sensations like this came only once in a lifetime.

The witness had paused. After waiting a moment for him to get his composure, Winslow asked gently.

"And what happened then?"

Shepherd's next words came with staccato sharpness.

"I shot at the man on the horse!"

Ann Jenkins put the feelings of the crowd into words when she whispered softly to herself: "My Lord, what next?"

"And then?" asked the lawyer.

"The man reeled on the horse's back and I thought he fell. I stumbled back through the brush to the road, rolling under the fence down the bank, and as I started to climb in the car, Taylor grabbed me. We fought in the road until he got me down. Then he forced me to drive rapidly to the Ball farmstead. There he got out and told me that he was going to forget my part in the night's doings and to go home and go to bed."

The man stopped.

"Yes," said the lawyer. "Where did Taylor go?"

"He walked across the yard toward the Ball milk house."

The crowd held its breath. Was he going to convict Taylor after all?

"I turned the car around and started back to Speedtown, and just as I pulled away from the Ball farm, I saw several men run around from behind Ball's barn and disappear in the dark."

"Is that all?" said Winslow.

"It is enough," said the witness, and buried his face in his hands.

Taylor reached an arm up to the lawyer standing by his side and pulled him over to whisper to him. The lawyer straightened and addressed Shepherd again.

What Happened in the Story Last Week

JIM TAYLOR'S trial is in full swing. No legal battle in years has attracted so much attention. The country for miles around is deeply stirred. The court room is packed with curious spectators. This is to be expected in view of the fact that all the principals in the trial are local folks. Dorothy Ball is the fourth witness called by the prosecution in its attempt to prove that Jim lead the men who dumped John Ball's milk in the ditch. She is asked if she could identify Jim as one of the members of the gang inasmuch as she was with Ball when he was trying to deliver his milk. Her reply was that she could not. She proved a good witness for Jim. The first witness to be called by Winslow, Jim's lawyer, was the rural delivery man. During the direct and cross-examination it is brought out that the rural delivery man personally handed a letter to Jim Taylor at the very hour when he was charged with having lead the gang that spilled John Ball's milk in the ditch. This was a perfect alibi for Jim. Realizing that such testimony would be dangerous to the prosecution, the District Attorney attempts to object and his objections are sustained. Winslow demands that the Judge retract his decision. He is about to deny the appeal when his eye is caught by Dave Messenger, the sheriff. What goes on between them no one knows but the Judge reverses his decision and allows the testimony to stand. It has a very pronounced effect upon the audience. The next witness is unexpected. He is Mr. Roscoe Shepherd, the Superintendent of the local milk plant owned by the dealers who are fighting the farmers. His testimony is in this installment.

"Mr. Taylor wants me to ask you to tell this jury what you told him as the reason for your unfortunate mistake on that fatal night."

The man's white face worked as he tried to control his emotions.

"My little girl was dying of consumption.....I was trying to save money to send her away.....I thought the loss of my job would mean the loss of her....But I was crazy.... and besides, it made no difference," he added wearily. "My little girl....died this morning."

The dull voice of the witness ceased. For a moment nothing could be heard but some of the women crying.

"That will be all," said Winslow.

There was no cross-examination. Well the prosecutor knew the juicker that witness was removed, the better for his case.

The eyes of the crowd and the jury turned back to Winslow.

"Your honor, and gentlemen of the jury," he said "the defense rests its case."

CHAPTER XXVII

Hamilton arose and walked briskly around the table to sum up his case. It did not take him long. For the most part it was a personal attack upon Taylor, a speech much of which in any other court would not have been permitted by the judge. But he was clever and made some telling points.

He reviewed and emphasized the character and reputation, and showed statements, particularly those of Ball, that during a long lifetime in the North Speedtown community John Ball had been an exemplary citizen, a good neighbor, a man of his word and of absolute integrity.

He then dwelt on the testimony of Dorothy and showed that it dove-tailed with that of her father, except that she did not actually identify Taylor as the leader of the gang that dumped the

milk in the road. On this point of identification, he tried to leave the impression with the jury that it was easy to see that Dorothy for sentimental reasons would not actually admit that Taylor was among the rioters who had dumped the milk.

When Hamilton started in his attempt to show that it was sentiment between Dorothy and Jim that would bias her testimony, Jim sprang to his feet, but Winslow caught him by the coat and pulled him back into his chair.

Winslow's summing up speech was also very brief, disappointingly so to Jim's friends, but the veteran jury pleader knew better than they when to stop. He spoke less than ten minutes, but in that short time he clearly showed

man to be mistaken. Gentlemen, Mr. Ball was mistaken. We have proven beyond refutation that Taylor was busy with his own work on his own farm at the very hour that Mr Ball's milk was dumped. Of what need there is to say more? I am perfectly willing to leave the cause of my client entirely in your hands knowing that he will receive justice."

The lawyer bowed and sat down, and the judge began his charge, which was so biased and filled with personal animosity that even the prosecuting attorney showing his uneasiness, knowing that the jury would rest against such unfairness. Hamilton looked at the judge, wondering what could have so upset his usually calculating judgment.

As Jim Taylor listened, his gaze wandered away for a moment from the judge to Dave Messenger, the sheriff, who was standing on the opposite side of the room. Jim's eyes were caught and held by the strange expression on the little sheriff's face. He was smiling, but even at the distance which the men stood, Taylor could see that the sheriff's eyes were hard and cold and that they were turned unwaveringly on the judge.

"THIS defendant," said Rising. "has been a disturber of the peace in this community for a long time. He has made men discontented with their lot, and provoked them by anarchistic methods to criminal and riotous action. Whether or not—"

To emphasize his point, Rising turned from the jury to the courtroom, and in so doing caught the peculiar menacing glare of the sheriff. He stopped, in the middle of his sentence, attempted to go on, reached for a glass of water, carried it tremblingly to his lips, and in a strange change of voice which had lost all of its belligerency and which could not be heard half way across the room, he continued:

"Whether or not he is technically guilty or was actually present in the outrage against John Ball and his property, this defendant, Taylor—"

Again the judge paused and took a drink of water, and with an effort at control, evident to everyone in the room, he resumed.

"As I was saying, this defendant, Taylor, is certainly guilty in fact of exciting men to commit these and other outrages, and as such, he is a menace to the peaceful pursuits of society!"

He then made a few more comments as to the interpretation of the law applying to the case, closed his talk, and ordered the jury to retire for their deliberations; then he arose rather hastily and retreated to the judge's private room.

The sheriff escorted the jury to its room. Then he came back and, looking neither to the right nor to the left, climbed the little stair to the judge's rostrum, and without knocking, he opened the door to the judge's private room and went in.

As Messenger passed Winslow, when walking across the courtroom, the lawyer noticed his grim, set face, and after the sheriff had disappeared, in the direction of the judge's retiring room, Winslow turned to Taylor and said:

"My boy, if I'm not mistaken, more important things than even your trial are brewing here today!"

The crowd relaxed a little and began to whisper or to talk quietly in undertones. Out of the open window a pair of robins chirped in the colorful maple to each other, while the mellow October sunlight flooded the green lawn of the park in quiet and calm contrast to the seething emotions of those who waited inside.

(Continued on opposite page)

Possibly fifteen minutes—it seemed longer—passed. There came a knocking on the door of the jury room. A court attendant went to the door, received a whispered message, then crossed the courtroom and disappeared in the direction of the judge's room. After a moment, he returned with the sheriff, who went to the jury room and escorted the jury back to their box. There came another pause, while the lawyers, attendants, and the crowd waited in surprised silence for the judge who did not come to receive the verdict.

Five minutes passed.—Ten. Those sitting in the front of the room heard a muffled "boom." The lawyers looked at each other, and then Hamilton arose quickly and went in the direction of the judge's room. A moment later he came back, walked straight across the rostrum and leaned on the judge's bench to support himself. He was trembling, and his face was white. The crowd waited. He hesitated in a visible effort to get control of himself and then with a break in his voice, he said: "Judge Rising—has shot himself!"

There was a moment of stunned silence followed by confusion, while a doctor and court attendants came and passed through the judge's waiting room into the little back office where the dead man lay on the floor. Time, tide and the inexorable law wait

for no man, not even the dead. A verdict was yet to be rendered, and the jury was ready. After a consultation between the lawyers, Special County Judge Gorham took his seat at the judge's bench. "Gentlemen of the jury, are you ready?" The foreman arose and stated that they were. "What is your verdict?" There was a slight rustle and a creaking of seats in the room as the crowd moved a little the better to see and hear the jury foreman as he answered: "We find, and his tone carried even to those who waited in the hall outside, 'the defendant not guilty!'" The people received the verdict in silence. Few even smiled as they waited for the judge to dismiss the jury. In the pause before this was done, Winslow arose, thanked the jury, and turned to the judge. "Your honor," he said, "this is indeed a momentous occasion, momentous in the tragedy which has just occurred, momentous still to every person in this room, in this county, and in this country, is the telegram which, with your permission, I should like to read. Although this is unusual, because of its very great importance, I trust that you will not consider it out of place. Moreover, it is news which we wish to get to every farmer in this community at the earliest possible moment, and the assembled crowd here gives us this opportunity." "Let me see the telegram," said the judge. He took it, read it, and handed it back to Winslow.

The Autographic Kodak Way

Whether you're disking the south lot, taking a Sunday trip, or stealing time to fish, today's Kodak snapshot is tomorrow's picture record. For in addition to the print that keeps the story there's the date and title you wrote on the film at the time—information you want for reference. All the Kodaks have this exclusively Eastman, autographic feature.

"Kodak on the Farm," a generously illustrated, 32 page booklet that tells about the fun side and the practical side of picture-making with an Autographic Kodak. Free at your Kodak dealer's, or by mail from us.

- 53 Pint (Abbr)

"You may read it." "This telegram," said Winslow, "is addressed to Mr. Taylor, and to the dairymen of this county, and it reads:

"Milk dealers have agreed to our terms. Release all milk and get word to your farmers that they may begin deliveries tomorrow morning. Signed Albert Manning, Secretary of the Dairymen's League, Inc."

Again the crowd sat in silence. Either because of the long emotional strain of the exciting day, or because of what the victory meant to most of them, they seemed nearer to tears than they were to cheering. Judge Gorham adjourned the court and silently, almost dejectedly, they arose and filed out of the sombre old court house.

Once out in the sunlight, as if by common accord, the crowd stopped. Suddenly, a big sunburned farmer grabbed off his hat and with a "whoop," threw it high into the air. Another one hit him on the back so hard as to make him gasp for breath. Then the lid was off.

Protecting The Afternoon

We Eat What We Have---Recipes---Another Applique Design

AMONG the many things in the home training for which I am thankful one stands out as the basis of order and system to this day, and that is the saving of the afternoon for what mother called clean work. Never would she allow us to wash after dinner, except in cases of extreme necessity, nor did we do any other form of what some folks call "rough work," after dinner. The work was divided so that such tasks as washing, cleaning, working in the garden (there were no boys in our family) doing chores about the lawn, scrubbing, canning, baking and all other big tasks had to be done by the noon hour. Her idea was that it wasted both time and effort to try to do such tasks after dinner, and though I did not see it then it has often been demonstrated to me later.

After dinner in clean dresses and aprons we sewed, making and mending, drove to

thought nothing of beginning a washing after dinner and canning late at night by the light of a coal oil lamp. I recall one young woman who started in to can raspberries after dinner with the dishes not washed and the kitchen in confusion. Callers came and in her soiled dress she sat down to endure the visit with her mind on the berries, but when she went back after a protracted call the berries were scorched and sugar and fruit wasted. Yet she had frittered away the morning darning stockings and reading a magazine.

To this day I can not get away from the quiet afternoon. Sometimes sickness or extra work disarranges my plans and forces me to do what I was taught not to do in the afternoon, but as quickly as possible I get back to the former plan. Somehow it seems that I am dishonoring my mother who has gone on if I neglect her teachings, and besides it keeps me sane and

IS it not a fact that on the farm we eat in the main what we have on hand, rather than what we buy? This is perfectly natural and is a fine thing so long as we have the foods necessary to a balanced ration. One way of meeting this need is to plan the garden so that we have for storage the root crops, cabbage, and celery to use in early winter and for canning greens, tomatoes, green string beans, peas and other so-called succulent vegetables for use after the stored crops are used.

Many colds and other indispositions of late winter especially would be avoided if plans are made in time to provide the right winter food. Now is the time to get ready for next winter's diet by planning in detail how we'll use our garden space and energy in working it so as to make sure of having plenty of the leafy vegetables and tomatoes, besides the usual store of so-called winter vegetables.

Try Something New

Don't be afraid to try something new every year, just to avoid falling into a rut, if not for the better reason of tempting appetites and having greater variety. If we decide beforehand that there's no use trying to change our food habits, we're pretty apt not to change them; but if we are open-minded and willing to give the idea a fair trial, then we shall be all the better for it.

"I Can't Eat That" is Taboo

The children at least ought to be considered in this, for the experts tell us that unless a child is prejudiced by his elders, he can be trained to eat any good food; it is man's nature to eat all kinds of foods, but sometimes if he lets himself go, he develops perverted tastes. As long as we are sure of getting a wide variety such as is provided by a good garden followed by storing and canning its products, we are building up resistance to many ills which befall mankind.

If we haven't the needed variety just now it is money well spent to buy lettuce or celery as well as some fresh fruits to provide the vitamins and the mineral salts which we are apt to lack at this season.

Delicious Apple Pudding

THIS apple pudding is just as good as apple pie or dumplings and is much more easily made. We welcome it as a change.

Place $1\frac{3}{4}$ cups of brown sugar in the bottom of a greased pan, then dot one-half cup butter over the sugar. Place over this the apples cut in eighths, or quarters if the apples are small. A pan 12 inches by eight inches by two inches deep is a very nice size to use, I find. From eight to ten apples are usually used.

Over the apples the following batter is poured; three eggs, one scant cup of sugar, four tablespoons water, one cup flour, one teaspoon baking powder, one teaspoon vanilla.

Bake 45 minutes, remove from pan as soon as the pan is removed from oven and place in serving dishes, for if allowed to cool in the pan the caramel substance in the bottom of the pan will become hard and can not be removed easily. This pudding is quite rich and the helpings should be small. This amount will easily serve ten persons. It should be served with cream.—NELLIE FARVER.

The Useful Tomato Can

A tin tomato or any kind of a vegetable can makes a good mouse trap. In opening cut from side to side so the tin at the top will be in four triangular pieces with a common centre. Bend triangles outward to empty can, wash and dry. Then bend in, leaving a hole in centre about three fourths of an inch in size. Put bait (I prefer fresh bread) inside can, and lay it on side in cupboard. A mouse can get in, tempted by the bread, but cannot get out.—L. M. T.

Applique for Apron

THIS pink blossom, buttonholed around with white and with a white embroidered square dot in the center, has black French knots for contrast. The leaves are green patches blind stitched on, with black veining. The sketch here shown is of an apron made of two "scraps," the side panels are pink like the flower, and the center unbleached muslin. The sections were all bound with black bias tape.

By grouping this design into three, and dropping the center one about two inches,

it would make a good end design for dresser scarf or in darker colors for a library table runner.

Two weeks ago, we published a design which might be transferred for embroidery emblems on middy blouses, and asked if you found it useful to drop us a card saying so. We shall repeat this request concerning this week's design and if you did not drop a line about the middy design, perhaps you will do so with this one.

town to do our errands, had visits from the neighbors and enjoyed some time for reading. One usually read aloud while the others sewed or made fancy work. Among the happy recollections of my youth are those afternoons under the maple trees on the lawn reading or listening to some worth-while story or magazine article. We were poor in this world's goods and a great deal of our sewing was patching, but we always had good magazines and books. To this day a high class young people's magazine is taken that was taken then, and some high grade magazines of that period are still read. We knew nothing of the piles of cheap magazines that now flood the book stores and pollute the mind with the vile stories.

And, looking back at it now, we accomplished more than our neighbor's who

healthful and well informed on the topics of the day to save the afternoon for quiet work and reading. In the evening the children hold forth, and there are lessons to be heard, and family conversations, and music to occupy the time, but what we used to call the "core" of the day is mine and in a clean dress with well arranged hair and nothing calling loudly from the kitchen I can entertain neighbors in peace and quietness. A hostess sitting on the edge of a chair not dusted and giving abstracted answers to the talk of the guests is never a charming sight. I'm willing to work very hard to get through by noon, for I can work just as hard at another task after dinner and enjoy both periods thoroughly.

The Home Maker Comes Into Her Own

Mother Sees---almost too late---that Henry's Chief Job is to Study

THE old saying that "them that knows does and them that don't know teaches," may have been true at one time, but it will not apply to the Bureau of Home Economics of the U. S. D. A. at Washington.

We home makers live such busy lives that it takes just about all our strength and time keeping the domestic wheels turning, so we have little opportunity to find out for ourselves some of the most vital facts concerning every day affairs.

Dr. Louise Stanley, chief of the year-old Bureau of Home Economics, says that the hardest task of the home-maker is deciding *what to do* and we believe Dr. Stanley is right. So many agencies and so many people are always telling us what to do that we are sometimes confused and don't know what is best. Therefore, it is comforting to know that our needs as women and as home-makers have been sufficiently recognized by the powers that be that a staff of experts are already at work on proper feeding, correct clothing, good housing and house equipment, and other experts will gradually take up more subjects which directly effect us in the home.

Since "science is classified knowledge," and "knowledge is power," we can expect from the Bureau much that will help us towards making right decisions—right because they are based on a foundation of fact and not hearsay.

The Lesson Period

HENRY had grown careless studying at home and his report card told such a sorry story that mother suggested that he study half an hour every morning between breakfast and school time.

The problem seemed to be, however, that there was no place where a little boy could give all his mind to his work during that busiest hour of the day.

Jane was clearing away the breakfast table, so he could not remain in the dining room. Mother tidied the living room, and, besides, there was someone always running in and out to take his mind from his books. His bedroom was cold, for he slept with the windows raised, and the kitchen was far from a quiet place for study.

It was mother who thought of the big chimney that kept the attic delightfully warm and the low window close beside it where the morning sun always shone straight in.

The first morning Henry liked his attic study, but the second and third he began to get lonesome, and the fourth he was just going down to tell mother he couldn't study away up there by himself, when he heard a patter of little feet and a bright eyed squirrel darted out from under the eaves.

Henry had a handful of nuts which he had taken from the breakfast table as he had left with his books and perhaps it was the sound of the snapping shells that called the squirrel.

The little boy rolled one of the nuts slowly across the floor and after waiting a few seconds the squirrel caught it in his paws and ran away.

In a little while, the squirrel had grown so tame it would come and eat the nuts out of Henry's pockets while the boy studied and when mother suggested that the last report card showed such good marks that the morning study period could be abandoned, she found her son much opposed to the plan.

"What I wonder," said father, "is how he knows when the half hour is ended; you never have to call him."

Then Henry took them to the attic and told them to keep very still and he would show them his clock.

Soon the little squirrel came out and began eating the handful of nuts Henry had placed on the floor. "When the last one disappears, it's a half hour" Henry

explained, "and my clock is better than the big one in the hall down stairs, for that one has to be wound every seven days while mine winds itself."—L. M. T.

Prune the Rose Bushes

YOU can have roses in quantity if you do not prune the hardy varieties, but you will not get the quality. I prefer one fine rose to several poor ones. While they are yet dormant cut back severely. One year the finest flowers I ever saw on a certain variety were produced after the whole bud had been cut off with a brush scythe. Long stems grew in large numbers and each bore magnificent bloom, full and perfect, while the blooms had ordinarily

Line the garbage pail with old newspapers, drain potato and other parings (if necessary) before dropping them in the pail and when it is emptied instead of the unpleasant task of washing it, all that need be done is to leave it in the sun for half an hour.—L. M. T.

For Flies in Winter

I would like to know what I could do about an open attic that has flies in it all winter. I have used everything that I know of but they are always on the windows, and such large ones! As I am a constant reader of your paper I thought that you could advise me.—Mrs. A. W.

ONE of the best solutions for attracting and killing flies is a dilute mixture of formaldehyde (40 per cent) and

All the Family Except Father Included Here

AMERICAN AGRICULTURIST patterns are seam-allowing and guaranteed to fit perfectly. They present the latest styles, adapted to the needs of the farm woman, and the charge is only a fraction of the cost of many of the patterns on the market. A large and steadily increasing army of women use them constantly and vote "AMERICAN AGRICULTURIST patterns the best ever!"

TO ORDER: Write name, addresses, pattern numbers and sizes clearly and correctly, and enclose correct remittance in stamps and mail to the Pattern Department, AMERICAN AGRICULTURIST, 461 Fourth Ave., New York City.

The smartest is the simplest in clothes this year. No. 2288 is the ideal one-piece dress. It allows for the use of one of the gay trimming materials so popular on dark cloth or silk. Sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 3 yards of 42 inch material, with $\frac{3}{8}$ yard contrasting. Pattern, 12c.

No. 2095 will please our plump friends, for it cuts in sizes 16 years, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 takes $3\frac{3}{4}$ yards of 40 inch material. Pattern, 12c. Hot iron transfer pattern 718, in blue and yellow, 15c extra.

2288

2095 Emb. 718

2248

1876

1807

2381

"Room to grow in" is allowed in No. 2248, which cuts in sizes 6, 8, 10, 12 and 14 years. Size 8 requires $1\frac{1}{2}$ yards of 36 inch material, with $\frac{3}{8}$ yard for collar and cuff. Pattern, 12c.

The girl has her slip, too, and No. 1876 cuts in sizes 4, 6, 8, 10, 12 and 14 years. Size 8 takes $1\frac{3}{4}$ yards of 36 inch material. Pattern, 12c.

No. 1807 is a blouse-and-knicker suit for the boy. It cuts in sizes 4, 6, 8, 10 and 12 years. Size 8 takes $1\frac{3}{4}$ yards for the blouse and $1\frac{1}{4}$ yards for the trousers, with $\frac{1}{8}$ yard lining. Pattern, 12c.

And for the smallest girl, No. 2381, which cuts in sizes 2, 4, 6 and 8 years. Size 4 takes $1\frac{1}{2}$ yards of 40 inch material with $1\frac{1}{2}$ yards ruffling. Short or long sleeves, as you wish. Pattern, 12c.

been very ordinary and not very double. I always cut back two-thirds of the new wood every spring. If they have been neglected then cutting out a lot of the old wood is needed. Cutting down to within a foot of the ground is a good plan. After this you can work on the new wood, leaving six or eight inches each spring of new growth. All everblooms should have every blooming stem cut back the same way just as soon as the flower begins to fade, and if it is cut when the bud is just opening so much the better, as that saves the strength that the plant will put into growing new shoots out so far they have to be cut off when cutting back. These new shoots start when the first bloom begins to fade. Removing all but one bud to a stem makes for finer flowers.

—L. H. COBB.

water. A teaspoonful in a teacupful of equal parts of milk and water, slightly sweetened with brown sugar, and then set about the room in shallow dishes, will attract the flies and kill many of them, especially if there is not other food or water upon which they may feed. A piece of bread placed in the middle of each plate for the flies to alight on will make the bait more attractive.

Pyrethrum powder might be purchased at the drug store. At night, have all windows and openings closed, sprinkle over the window ledge and other infested surfaces. In the morning, the flies will be either dead or stupefied; then they can be swept up and burned.

Use stiff bristled brush for sprinkling clothes.—E. B. G.

Why do millions of women feel that nothing can take the place of Fels-Naptha for washing clothes? Naptha—the great dirt-loosener—and splendid soap working together make dirt let go quickly, safely, thoroughly!

Service Bureau

How the Song Sharks Get Rich

"Can you advise me whether or not the Equitable Music Corporation of 1658 Broadway, New York City, is reliable? On March 2nd, 1925, I sent them a song manuscript requesting if not satisfactory to return. Today I received a sample contract also a form letter, but they still have my song."

"As both the contract and letter state that this company will pay to the author \$250 beside royalties, I wonder if there might be a 'catch' whereby the author might be forced to spend money. I shall answer at once as I have a few questions to ask them. If they assure me I shall not have to send one cent to publish this song, then I shall sign their contract."—Mrs. C. B.

"CATCH" is right. This business of the song sharks is about the worst species of grafting on and devouring suckers that we know of, and we cannot urge you too emphatically to keep away absolutely from all such schemes. This kind of grafting has assumed such large proportions that the reputable music publishers have joined themselves into a Protective Association, to prevent people from losing their money with the song sharks.

Mr. Ashby Deering, writing for the Music Publishers' Protective Association in the New York Morning Telegraph, says:

"The suckers do the dreaming and the song sharks reap the profits. * * *"

"If the public could know of the miserable species of graft that these so-called melody corporations, 'harmony studios' and fake publishers practice upon unwary but ambitious amateur song writers, these earnest aspirants would be saved every year not only substantial sums of money but many a disappointing, heartbreaking discouragement. * * *"

"How does it work? The grafters advertise in rural districts urging readers to write a song poem. To write a song about country, home and mother. And, the ad speciously urges that the poem thus written be submitted for comment and criticism 'without cost or obligation'."

"What happens? The sucker writes his poem and sends it in. Regardless of its merit, or the lack thereof, the victim receives by return mail from the 'studio' an extravagantly worded letter praising in fulsome and flamboyant terms the merit of the poem. I have seen these letters written commenting thus upon the most utter trash that the mind of a human being ever conceived. But 'all's grist that comes to the mill' of the song shark."

Then the article by the Music Publishers' Protective Association goes on to say that if the sucker has been led along sufficiently far, he finds that he must pay \$50 to \$100 or more to get his song copyrighted and sent to the music publishers. In order to get around the post office rules, a few shoddy copies are printed and sent to the music publishers who promptly consign them to the wastepaper basket. This costs the music sharks a very small sum of money, and all of the rest is pure velvet."

AND HERE IS THE THING TO REMEMBER: IN THE ENTIRE HISTORY OF THE SONG PUBLISHING INDUSTRY, THERE HAS NOT BEEN A SINGLE EVEN MODERATELY SUCCESSFUL SONG PRODUCED THROUGH THE MEDIUM OF THESE FAKE CONCERNS FOR ANY OF ITS VICTIMS.

E. C. Mills, chairman of the Executive Board of the Music Publishers' Protective Association, says:

"Barnum was right. There is one born every minute. And from the volume of the productions these fakirs send out which comes to my desk, I calculate that in the aggregate they must 'string' at least 100 victims a month. * * *"

"I have seen these grafters take the money a crippled girl had saved for an operation when they knew, because she told them so in her letters, how necessary it was that their advice to her be careful and honest."

Now let us add a word from AMERICAN AGRICULTURIST. The creative instinct, the wish to do, to build, or to write, runs high in all of us. The result is that a majority of people have an idea in their hearts that they can write poetry or songs. We do not want to discourage any creative impulse, yet it saves disappointment and heartache to tell 'he truth, and the facts are that there is not one poem in a thousand that comes into an editorial office that is really of high enough grade to publish. Mere rhyming, mere sentimentalism, is not poetry, in spite of all that your friends might tell you. Therefore, editors of all publications have to continually turn this stuff—and we know what a

sinking of hopes it gives the would-be writers to get them back.

As for the song grafters, remember that no reputable publishers will accept any fee whatever from a writer, nor does any reputable publisher make a business of composing music for song poems. Therefore, under no circumstances, unless you want to give it away, should you send money to any of these song sharks.

Automobile Accidents

AUTOMOBILE accidents in New York State alone during 1924 were responsible for the deaths of 2,029 persons. This was 63 more than the total for the previous year. Of course, the number of people who were seriously injured and maimed for life is much greater than this.

The increasing number of accidents is the chief reason why the AMERICAN AGRICULTURIST has made arrangements with the North American Accident Insurance Company to have our salesmen sell an accident policy at cost to our people who take AMERICAN AGRICULTURIST. We have investigated this company and this policy so that we know that it is right and we believe it is one of the best services that we are rendering our readers. Some 25,000 of our people already have protected themselves with this policy.

Settled By Arguments

IN these days of many outside interests and diversions, we often find much to do besides going to the meetings of the young people's church organizations. The time when all of us (Baiting Hollow, L. I.) went—and most of the congregation from our neighbor church (Sound Avenue, L. I.) as well—was when there was a joint debate instead of regular young people's meeting. The subject was: Resolved, That war should and can be outlawed in this generation. It drew forth strong arguments pro and con and the ex-members of debating societies again had a chance to show their old time skill.

The idea of such a debate has a wonderful appeal to the interest of the two communities involved, besides being fine training for those who take part in it.

Give Us A Chance

I am pleased to refer you to your recent letter which was duly received. I am also pleased to advise you that I have today received a check for \$16.95 from the company against whom you have been handling my complaint. This is the full amount of the claim which you so promptly and efficiently handled for me. My vocabulary is too limited to fully express my gratitude to you. I shall await your advice as to the amount of your percentage which will promptly be forwarded you upon its receipt.—J. L. H. New York.

This was just another of the many letters which we get which makes it a pleasure to start the day off each morning by opening the Service Bureau mail. Let us repeat again, that there is no charge for our services. If you have a just complaint and if you cannot settle it yourself, send it in together with all of the details and the facts. Do not wait too long however, and then expect that we can settle it, and also be sure that your complaint is just.

Commission House Goes Bankrupt

An involuntary petition in bankruptcy was filed against A. Paul, Jr. & Company, Inc., 50-62 Grace Ave., West Washington Market, New York City on March 11, 1925.

As this firm was a licensed and bonded commission merchant, creditors are protected from total loss by the bond which the concern is obliged to put up with the New York State Department of Farm and Markets when starting business in New York. All subscribers having claims against this company are requested to send all papers to the Service Bureau, after which time information will be given them as to how to proceed to file their claim.

This is your market

New York Central Lines reach 174 cities with a population greater than 10,000.

These cities, which produce more than half the country's manufactures, spend millions of dollars per day for food from the farms.

A farm on the New York Central Lines not only has the world's biggest market at its door, but is assured of dependable railroad service to this market every day of the year.

A Modern Patriarch

The Story of a Man Who Trusted in the Soil

A GOOD many years ago—so many that I am sure everyone save me has forgotten it—the Cornell Countryman printed a little outline history of a farm family whose career was a part of my boyhood knowledge and observation.

Jared Van Wagenen, Jr.

The story seems to have caught somebody's attention for the old and now bygone Tribune Farmer did me the honor of copying my tale and thus it attained a wider circulation than I had ever hoped. Since then my own philosophy of life has somewhat changed and also the intervening years have added another chapter — have brought the history that much nearer to the end and so I crave leave to rewrite it and to set it down as a contribution to our knowledge of the fundamental social changes which are going on in our farm communities and if any one shall find interest therein, I beg them to remember that it is not a tale spun from fancy but instead a sober chronicle of happenings.

The man who is really the hero will be called Paul for the very good reason that he was so baptised but it is not at all necessary that I add his family name or that I exactly locate his home upon the map. It will be enough if I say that his farm lay in a long settled region somewhere among the hills of Eastern New York.

It was a very good farm indeed. True — it lay high above sea level and often the winters were long and cold but the fields were rolling limestone hills where winter wheat might lie safely hidden beneath the snow until March came and where clover grew rank and vigorous because its roots wrapped themselves around the

By JARED VAN WAGENEN, Jr.

abundant limestone pebbles in the soil. All in all, it surely was not a bad place to live or to farm—more than is usual for farms in that particular region. In summer the sunshine lay sweet and warm on all the little hills and dales which made Paul's kingdom and I am sure that he looked out and over it with content and with pride and fondness in his eyes.

I have no precise knowledge of just how long Paul's fathers had tilled these fields. His family was German and I assume had come along with a wave of German immigration which had flooded into this particular region about the middle of the preceding century. One day a few years ago, I visited the old forgotten farm graveyard where Paul and his fathers lie buried. The spot has been so long neglected that it is now only a dense, tangled thicket of young elm and choke cherry and dogwood and wild red raspberries but forcing my way into it I read upon the stone that the Paul, of whom I write, was born in 1800 and that he was old when he died, which will fix the date of his life story. He himself was American born but to the day of his death, when he spoke in his own family, it was in the tongue of the Valley of the Rhein. Often my father who knew and well remembered him has told me his story.

He was a good man according to his light—active and zealous in his ancestral Lutheran Church. Probably never in his life did he conceive of science or the things which are written in the books as applicable to the affairs of his farm, yet nevertheless he was according to the standards of his time, an unusually wise and progressive and painstaking farmer. In that era this region grew a good deal of wheat—one of the few products for which there was always a cash market at Albany, fifty miles away and Paul led all his neighbors in the production of the noble grain. He was a very enthusiastic believer in the practice of the old time summer fallow—a method now almost extinct in our agriculture. Of course, the plan was wonderfully expensive in the labor involved and the use of the land was lost for the season, but it did result in a seed bed where all weed seeds were killed. Moreover the long summer of cultivation set free fertility and always there was tilth like an onion bed and abundant moisture for prompt germination so that almost never did maximum crops fail to reward this most careful husbandry.

It is safe to guess that Paul married not long after attaining manhood and his family life prospered and expanded with the years so that eventually he came to sit at the head of a patriarchal board and look down along a mighty line of sons who in number if not in name, suggested Jacob's tribe of old.

That was still in "The Golden Age of Home spuns" when every farm was a little empire in itself and Paul ruled his little kingdom with a firm and yet wise, just hand. It was wonderful how little actual cash money was needed in that day in the farm economy. There were very few farm products for which there was an assured market and it was barter and exchange rather than sale by which the farmer lived. Of course,

(Continued on page 392)

Chase gloom from every room—with lead paint

YOU may remember how cheerless and unattractive the interiors of so many farm houses were a generation ago. Rooms looked like the one in the top picture—dark, gloomy, depressing. Many pieces of furniture, some of them of poor design, uncomfortable-looking and forbidding, stood about. Ornate wall decorations added to the confusion.

Such rooms are disappearing. Today women everywhere want cheerful surroundings—bright happy homes, attractive rooms to live in and work in—like the one in the lower picture.

Many farm women have found it easy to make this change in their homes. They stored the worst-looking and most useless furniture and knickknacks in the attic and thus gave the remaining fine old furniture space to display its beauty. They made other changes.

But the most important thing they did was to paint walls and ceilings simply and in tints that lightened and brightened the entire room. And in this work these women were helped by a remarkable interior flat paint. They used it with unusually beautiful results.

This new paint is made of white-lead—itsself very old—mixed with a new flatting medium—Dutch Boy flatting oil. Dutch Boy white-lead, a pure product made from the metal lead, makes with the flatting oil a flat paint that gives new beauty to new walls and greater charm to old walls and ceilings.

Dutch Boy white-lead and Dutch Boy flatting oil gives full protection to the covered surface, whether it be plaster or wood. It makes interior finishes of rare beauty—finishes like those found in the finest homes in

America. Take this paint, add the proper coloring matter to it, and you can get any tint or shade you desire. Either plain walls or two-tone mottled effects may be had.

Besides the beautiful finishes and the protection it gives, this flat paint has other great advantages. It is an economical paint because it has unusual spreading power and saves the surface for a long, long time. It can be easily cleaned with soap and water without harming its original beauty. It is easy to apply. It can be quickly put on in a smooth, even film that is free from brush marks and laps.

We will be pleased to send you a free booklet, "Painting—Protective and Decorative." This booklet tells what paint is, what paint does, and why paint protects the surface. It contains color plates of house exteriors and interiors and also of beautiful and unusual finishes obtainable with paint. The booklet sent free on request.

The picture of the Dutch Boy trademark on every package of Dutch Boy white-lead and Dutch Boy flatting oil is your guarantee of excellence.

National Lead Company also makes lead for practically every purpose to which lead can be put in art, industry and daily life. If you want specific information about any use of lead or of lead paint, write to the nearest National Lead Company branch.

Just Before We Plant

Short Crop and Garden Experiences

THE following facts were given me by Mr. Henry Heiland, the "Corn Man" of Southern Pennsylvania. He has made corn study a specialty for years and knows what he is talking about.

FIRST: Use good seed corn of a variety that is adaptable to your community.

SECOND: Use manure to supply humus and help retain moisture and grow the crop. Hog-manure preferred, but all other kinds are good.

THIRD: Use fertilizer preferably 2-12-4 Amonia to start the plants in the spring until the bacteria action gets started and phosphorous and potash to finish the crop.

FOURTH: Practical cultivation must be given enough to keep the weeds down, the corn cannot be crowded to grow a big crop. Cattle are the best market for corn on the farm, and ensilage increases milk production many percent.

FIFTH: Mr. Heiland uses a tractor to plow and prepare his corn-land and he plows four inches in the fall and seven inches in the spring.

Personally I have found it to an advantage to plant the kernels of corn, then cover them with dirt and the manure has been placed on the ground the preceding fall. Or another way is to put manure in the hill, then cover it with dirt and then plant the corn on that, then to cover the corn over. This generally makes a productive crop.

—LAWRENCE HAYDEN.

Sulphur Checks Scurf Disease of Sweet Potatoes

SUCCESSFUL control of the scurf disease of sweet potatoes by the use of sulphur has been accomplished by several New Jersey growers in the vicinity of Vineland. Two of these men report that 300 pounds of ground inoculated sulphur to the acre resulted in a 50 per cent reduction of the disease. Other growers state that previous to using sulphur their entire crops were so severely blackened with scurf that they were worth less than half the price of a clean crop. Some men estimate an increased value of \$1 to \$1.50 per bushel as a result of the new treatment.

The old fallacy that if an ounce of care is good a pound is better, is particularly dangerous in using sulphur, several of the growers have discovered. One of them as an experiment used 400 pounds to the acre and as a result of this 100-pound excess, had to reset 1000 plants per acre. This experiment bears out the belief of the New Jersey experiment station pathologists that 300 pounds per acre is the best amount to use.

Asparagus Is Not Hard To Grow

MRS. EDITH SWOPE.

WHEN we consider all the different varieties of vegetables and otherwise to be found in the average garden on the farm, there are none that have any greater qualities than that humble plant known as asparagus. I am aware of the fact that some make claim to its being a hard plant to grow. Personally I have found it to be no harder to grow than some other plants and vegetables. It is a fact that asparagus will never grow and amount to anything in poor ground or soil that is not rich in humus. If we have ground of this sort, we must first of all make it rich and mellow and select a location somewhere, so that the ground will not dry out too rapidly. Such a location must, however, not be too wet, but one that is drained naturally if we wish best results with asparagus.

A Good Local Market Proposition.

My method is to set the crowns about two feet apart each way, and being sure to plant down in the soil five to six inches, pressing the dirt firmly. These plants must be allowed to grow or mature somewhat

for a full year before they will be ready for cutting the next spring and early summer. A small-sized plot will be sufficient for an average family, but then there is always a demand for asparagus. That the supply has never been equal to the demand, then asparagus becomes a very valuable addition to the garden plot as a market possibility where one depends on marketing the surplus.

I know one woman who has a fine plot and in a very favorable location, and she sells a great deal of asparagus, more than she can supply, the demand being so great. The profit she makes from that small plot of ground runs up into impressive totals each year. She, too, shares my opinion that more of this plant should be under cultivation in the average farm garden for home use and for market purposes. —MRS. EDITH SWOPE.

Maggots in Onion Roots

I want to find out what I can do for onion worms that are in my garden and how to get rid of them. When the onions are a certain size they die and when we pull them out the roots are full of white worms. What is the cause of that?—Mrs. J. F., Pennsylvania.

UNDoubtedly your onion patch has become infested with onion maggots. These maggots are similar to the species that attack the roots of cabbage and radishes. The eggs are laid by a fly that is about the same size as an ordinary fly, although differently shaped. It has longer legs and longer wings. The eggs are laid by the adult fly in the leaf sheaths. The maggots that hatch from these eggs work down into the bulb. There may be anywhere from two to four generations each year.

For one thing, the maggots hibernate in the bulb of the onion itself. Therefore, if you were using your own sets, it is advisable to discard any onions which may show infection while the sound ones should be disinfected with carbon bisulphide.

In controlling onion maggots there are very few positive control methods. One of the most recommendable controls is the use of carbolyzed kerosene emulsion. This may be made by boiling a pound of soap in one gallon of water, add to this one-half gallon of crude carbolic acid, then dilute the whole with thirty-five to fifty gallons of water. This mixture is thoroughly stirred and then sprayed on the base of plants and the seed bed rows. It is advisable to apply this a day or so after the plants are up or after transplanting and is repeated every ten days until three or four applications have been made. It is said that tobacco dust is also a very good deterrent.

Why Compost Garden Manure?

GARDENS are better without fresh manure applied for a number of the important garden crops are injured by it. It has a tendency to produce heavy top growth at the expense of fruit in potatoes and tomatoes and some other crops, while it not only forces excessive top growth in beets and other root crops but gives roots of inferior quality as well. It will help lettuce, mustard, and such crops that the leaf is the part used but these are too small a portion of the garden to make it profitable to use it. It also causes soil to dry badly for it will not become compact enough to hold moisture and the fermenting will injure roots of tender varieties. Composting manure will kill the noxious weed seeds, which is another valuable reason for doing it, and cultivation is so much easier when no coarse manure is present.—L. H. Cobb.

Farm Bills Passed at Albany

Tax, School, Automobile and Other Laws That Affect You

TAX REDUCTION" was probably the paramount issue in the 1925 session of the legislature, so far a popular interest, both rural and urban, was concerned. And yet, according to the Republicans in the legislature, "tax reduction" was never an issue. They claimed that Governor Smith's appeals for tax reduction were really for "tax shifting," and that his insistence upon a cut of 25 per cent again this year in the personal income tax was in favor of comparatively few with large incomes and at the expense of the farmer and home owner who must pay the direct tax.

From the beginning the Governor insisted that the finances of the state would permit passage of a bill for the 25 per cent income tax, saving some \$8,500,000 to that class of taxpayers. Also from the beginning, the Republican leaders in the legislature declared they would gladly cut the income tax if possible, but that any tax cut ought to go first to those who pay the state's levy on real estate, the direct taxpayers.

The Governor won a clean-cut victory, and on the last day of the session, last Friday, both houses approved a bill which was introduced by Assemblyman Phelps, Republican, of New York, to permit income taxpayers to keep one-quarter of the amount due in tax, as computed on their blanks. The next day the Governor signed the bill, with news and motion picture cameras clicking to record the event. He hurried to put the measure on the statute books, he said, because of the fact that already some \$3,000,000 had been paid in personal income taxes, 25 per cent of which the state must now return.

But, if the legislature was not able to reduce the direct state tax, it was able at least to keep it at the same figure. On the last day of the session, also, there passed a bill which fixes the direct state tax at $1\frac{1}{2}$ mills, the same as last year.

The effort of the Governor to keep the personal income tax down had its effect, directly and indirectly, on other measures of special interest in the rural sections. Perhaps the one of most direct concern is that to make appropriation for the payment of owners of cattle killed by the state because of bovine tuberculosis.

Appropriations for T.B. Cattle

Originally the bill to appropriate the funds to pay claims for the killing of diseased cattle, introduced by Senator Leigh G. Kirkland, Republican, of Randolph, and Assemblyman Daniel P. Witter, Republican, of Berkshire, Tioga county, carried \$4,000,000. Governor Smith recommended that this be cut to \$2,000,000 on the claim that not more than that amount could be spent before January 1, 1926, after which date the next legislature could make the additional \$2,000,000 available for the rest of the fiscal year, if necessary.

Republican leaders opposed this step on the ground that it was unsound financing. Nevertheless, since the payments for diseased cattle are actually made on the rate of about \$2,000,000 every six

By THOMAS C. STOWELL

months, they finally agreed to the proposition. It was in this form, then, that the bill finally passed both houses and went to the Governor. Before it was amended, it had passed both houses at the higher figure and had to be recalled.

Another proposition of special interest in the rural districts, which became tied up with the income tax cut controversy, was that to increase the state aid for rural schools. Bills intended to put these new quota provisions into effect were introduced by Senator Ernest E. Cole, Republican, of Bath, and Assemblyman F. Trubee Davison, Republican, of Locust Valley, Nassau county, also carrying \$9,000,000 appropriation necessary to pay the state's share of the increased quotas.

Governor Smith recommended that the increase quota bills be passed, but that the appropriation be deferred until the next session since the money would not actually be spent until the fall of the next year. The Republican legislative leaders objected strenuously to deferring the appropriation. They said that the districts must make up their tax budgets this fall and they could not legally take advantage of the additional money unless it were actually appropriated. Furthermore, they claimed, this legislature could not bind the next legislature to an appropriation of \$9,000,000.

The Republicans claimed that Governor Smith had agreed to the rural school bills, and the necessary appropriation, even when his attention was called, at a conference, to the fact that ap-

propriation of the \$9,000,000 would mean no income tax reduction this year.

"I will defend it on the stump if necessary," they quoted him as saying.

This the Governor denied emphatically, and insisted that the appropriation could easily be deferred until next year without any injury.

Both sides were insistent. Finally the legislature agreed to defer the \$9,000,000 appropriation, but they held they would also have to defer operation of the new quotas. They therefore passed the Cole-Davison bills, making them effective next year instead of immediately. These bills are now with the Governor.

Equalization of School Tax

Among other Cole education bills which passed both houses and went to the Governor, is one relating to the equalization of school taxes within joint districts. This would add a new section, providing as follows:

"In a joint district that is not within the jurisdiction of a district superintendent of schools, and in a city school district which comprises the whole or part of the territory of a city and the whole or a part of the territory of one or more towns, the duties which would otherwise be performed by the district superintendent under the provisions of this section, shall be performed by the board of education of such district."

To Let Farm Boys and Girls Drive Cars

An unusual situation arose concerning legislation for a junior operator's license for motor vehicles, a measure of special interest in the rural sections of the state. Mrs. Rhoda Fox Graves, Republican, Gouverneur, member of as-

sembly from St. Lawrence county and the only woman legislator this year, early in the session introduced a bill to provide for such a junior operator's license. This was soon followed by similar bills, the most prominent of which were introduced by Senator Leigh C. Kirkland, Republican, of Randolph, and Assemblyman Kenneth H. Fake, Republican, of Cobleskill.

As the legislature was nearing the end of its session last week, Senator Kirkland's bill was passed in the upper house and went over to the assembly. Assemblyman Fake suggested, on the floor of the house, that Mrs. Graves' bill, which had also been reported from committee, be passed first, as a compliment to her. This was done, and Mrs. Graves was applauded as the bill passed unanimously. Then the assembly also passed the Kirkland-Fake bill. It was not expected that Mrs. Graves' bill would get any farther, since there was no companion measure in the senate. When it reached the senate, however, it was passed unanimously, without discussion. Therefore, Governor Smith now has before him two bills to provide for a junior operator's license.

The bills are virtually the same. They provide that licenses to operate motor vehicles may be issued to minors 16 and 17 years of age—the present minimum

Farm Results from the Albany Legislature

DO not miss the report of Mr. Stowell on our feature page on the different bills affecting the farm business which were considered by the New York State Legislature just adjourned. Some of these bills passed are not yet signed by the Governor, so watch AMERICAN AGRICULTURIST for further reports. The fight which the New York Conference Board of Farm Organizations, including the New York State Grange and the New York State Federation of Farm Bureaus in cooperation with AMERICAN AGRICULTURIST, made for a fair deal for farmers at Albany this year resulted in a general compromise. We won a victory on some issues, a partial victory on others, and some of the things we stood for failed this year.

The biggest scrap was over the question of which tax should be reduced, the income tax or the direct state tax on real estate. This was very plainly an out and out fight between representatives of the city and representatives of the country. The result was exactly the same as last year, the direct state tax was held down to a mill and a half and the income tax was reduced 25%. It should be made clear that this income tax is no lower with this reduction than it was last year, but neither is the direct state tax. In other words, the fight ended in something of a draw.

But even a draw is clearly an injustice to farmers. In fairness, the income tax should not have been reduced at all, and the direct tax should have been entirely abolished. The reduction of income tax helps a comparatively few people; also they are people with incomes who are well able to pay the taxes. The direct state tax, as we have pointed out many times, is in the first place a wrong principle of taxation and in the second place, a taxation of property which in the case of farmers is not paying any income and therefore in no position to pay state taxes in addition to all the local ones.

AMERICAN AGRICULTURIST has had representatives in Albany this year time and again, and we have wired and written the legislature several times in standing for justice to farmers on this tax question. The Grange and the Farm Bureau were also especially active in trying to get justice for farmers, but it is

sometimes a little discouraging because of the indifference of farmers themselves. When the question of reducing the income tax came up literally thousands of city people with incomes wrote or telegraphed to legislators at Albany. Very few farmers did. Therefore, except for the work which this paper and the farm organizations did, it looked as if the argument was all on one side.

We are going to keep up this fight for the reduction of taxes. If farming is to endure, there must be a reduction of the tax burden. But we wish we could impress it upon our people once and for all that the farm organizations or the farm papers cannot win this fight alone.

Other legislation which we stood for at Albany this year included a tax on gasoline. As reported by Mr. Stowell, these bills died in committee.

On the opposite page is a summary of rural school legislation passed this session. These laws are a distinct victory for rural people. The large item of State aid which will go to reducing taxes in rural school districts eventually will go a long way toward helping to reduce the rural school taxes. The other school legislation will correct some injustices and eventually help farmers themselves to bring about some school improvement.

AMERICAN AGRICULTURIST stood for adequate appropriations for farmers to pay for cattle condemned because of bovine tuberculosis. While we think this appropriation was passed in an unbusinesslike form, yet the appropriation will be large enough to properly carry on the work.

The bill giving the country boys and girls the privilege of obtaining junior licenses for driving automobiles passed both houses. It is now before the Governor. We are not sure what action the Governor will take on it, so here is your opportunity to telegraph or write the Governor immediately asking him to sign this bill. A full report of what the bill is, is given in Mr. Stowell's article on the feature page.

The Way To Good Apples

GOOD apples can no longer be grown in this country without giving them the same or better care than is given to other crops, and in particular, unless they are well sprayed. The need of spraying is especially important for the finer grades of apples. McIntosh, for instance, are particularly susceptible to apple scab and McIntosh, because of their fine quality are in increasing demand on the market. Last year, the first class McIntosh were sold as high as twelve to fourteen dollars a barrel in some instances.

The late dormant spray with lime sulphur, applied just before the leaf buds open, is essential to control scab. If you have a few trees, maybe you can get a small sprayer or cooperate with a neighbor in the use of his machine. The materials are not hard to obtain. The directions for applying are simple, but whether you have a small home orchard or a large commercial one, if you want to be sure of any apples of any degree of quality, they must be sprayed.

We Hope You Like It

AS we were putting the articles of information in this issue of AMERICAN AGRICULTURIST together in shape for the printer, we could not help but feel pleased with the large amount of service which we are rendering in the paper in giving farmers the impartial facts about the things they are most interested in. Just leaf over the pages of this issue and see if you do not agree with us. We start on the cover page with an article by Jared Van Wageningen, that greatest of farm writers. On the second page there are two columns of right up-to-the-minute information articles that you will be thinking about in your everyday work this spring. On the next page, we

have boiled down in the article by Mr. Stowell a complete review of what the New York State Legislature did this year of interest to farmers. And on the page opposite the editorial, there is a clear explanation of the Cole Rural School Laws, in which every farmer will be intensely interested.

And so on through the rest of the paper, timely articles covering every part of the farm business, a carefully prepared and accurate review of the market situation, news from the field on what farmers in all parts of our territory are doing, page of material of especial interest to the farm womenfolks, and the serial story, "The Trouble Maker."

We cannot help but be proud of this issue, and we hope that you will like it and that it may be of some service to you.

Van Wageningen's "Farmer Paul"

YOU will not want to miss Jared Van Wageningen's great story on the first page of this issue, which he calls "A Modern Patriarch." No farmer can read this without a better appreciation of the fundamental joys and happiness that are part of the compensation of farming. No one can read it either without a little feeling of regret that we of this age have come so far from the good and simple ways of life and living, so well exemplified by "Farmer Paul."

Eastman's Chestnuts

I'LL wager that I have heard various versions of the following story at least a dozen times. In fact it is such an old chestnut that no doubt some of you may call it "wormy" but I never hear it without getting a good laugh. So perhaps it is worth repeating.

My version goes something like this:

A bedraggled-looking tramp who happened to be a ventriloquist was walking along a street and wondering when and how he was going to pick up something to eat. He overtook a stray tramp dog and they joined company. With the dog at his heels, the tramp went into a restaurant and just as they passed through the door, the dog said to the tramp:

"Sam, what kind of a bum joint are you leading me into?"

"That's all right, Fido," said Sam. "This is not much of a place, but we've got to eat somewhere and we haven't much money."

"All right," said Fido, "I can stand it if you can," and they walked up to the self service bar where the proprietor of the place stood looking at the dog with his mouth wide open in amazement.

"A talking dog!" exclaimed he. "I never heard of such a thing. I would like to own him. What would you take for him?"

"Oh, I wouldn't sell him for the whole world," said the tramp.

"That's right Sam," spoke up Fido, "I know you wouldn't sell me. We've been comrades too long."

"Don't worry, Fido," said Sam, with tears in his eyes.

"I'll give you a hundred dollars for him," said the restaurant proprietor.

"Don't you sell me, Sam," said Fido.

The proprietor kept raising his bid until he finally offered Sam three hundred dollars for the dog and Sam took the money and put it in his pocket.

Then Fido said reproachfully:

"Sam, you've finally sold me, haven't you?"

"Yes," agreed Sam, "I had to."

"Sold me, after all of these years that we've had together, sleeping under the same hedge, sharing the same crusts."

"I couldn't help it," cried Sam, "I couldn't help it. You know, we haven't eaten for three days, and I was thinking of you as well as myself. Now you will have a good home."

"That may be all right," said Fido, "but just the same, I'LL BE DARNED IF I EVER SAY ANOTHER WORD AS LONG AS I LIVE."

How The New Rural School Laws Will Work

Will Reduce Local Taxes and Lead Gradually To Better Schools

THE new rural school bills explained on this page are in our opinion the most important farm legislation passed by any legislature in many years. These laws will affect the lives and fortunes of many generations to come; they will greatly reduce the school taxes in every poor rural school district of New York State; and they will make possible to farm people themselves the opportunity to give their children such additional school opportunities and privileges from time to time as the boys and girls desire and need. **THESE COLE BILLS JUST PASSED BY THE LEGISLATURE DO NOT REQUIRE OR FORCE ANY CONSOLIDATION NOR DO THEY REMOVE ANY LOCAL POWER OVER THE SCHOOLS NOW HELD BY FARM PEOPLE.** The rural school, the so-called little red schoolhouse, is preserved and kept intact just so long as the people themselves wish to keep it so.

Mostly Amendments

Practically all of this legislation is in the form of amendments to the old law and is passed in such a way that there is no upsetting or overturning of the present rural school system. Financial encouragement is given to districts when they for any reason wish to get together, and it is easier under the new law for farm young people to get a high school education. But there is nothing in this legislation that is mandatory or compulsory and the situation as to what you want to do with your schools is still as much *in your own hands* as it was before these new laws and amendments were passed. In other words, whatever changes are suggested, with the exception of more financial aid to help reduce your taxes, **ARE ENTIRELY OPTIONAL.**

A Long Fight For Farm Justice

This rural school legislation represents a long hard fight on the part of many farm people who are really interested in getting some aid to reduce the high rural school taxes that exist in thousands of districts and in providing a plan whereby local people could make such improvements in their schools as they thought wise. In this fight, **AMERICAN AGRICULTURIST** has taken the lead, and because we have, some of our farmer friends have criticised us. We have taken this criticism and stood up four-square to the world on this proposition because we were absolutely sure that constructive school legislation which would not compel consolidation but which would reduce local school taxes and give country boys and girls additional school advantages was absolutely right; and this paper believes in standing for the right and standing for what is the welfare of agriculture in spite of criticism, no matter how bitter.

The Saving In Taxes

There has been a lot of misinformation and propaganda put out against any rural school legislation. It seems to be an issue that comes handy for bringing a certain kind of popularity to those who oppose everything. All that we ask is that you make a careful study of these new Cole Rural School Bills which are explained in this article. If you have any doubts about them, read the examples below showing how taxes in hundreds upon hundreds of poor rural school districts will be reduced when these laws become effective. Under this legislation, there are districts in the State whose assessed valuations are so low that a man living in such a district and having a taxable valuation of \$5,000 will save \$70 a year in reduced school taxes over what he has to pay now. To be sure, these savings

are the greatest in the poor districts. If anyone begins to grumble about these new laws, ask him what the valuation of his school district is, and if it is high, you will see the reason for his grumbling. Even at that, the law will help some in the wealthy districts too.

But one of the greatest injustices done to thousands of farm people in this State is the present inequality of the school tax laws. This injustice is particularly hard on the farmer in the poor districts back on the hills. The large increases in State money will help to do away with at least a part of these inequalities and correct an unfair situation.

How the Cole Bills Got Started

Just before this year's session of the New York State legislature opened, we began to

Study The New Rural School Laws

ON this page there is a review of the events which lead to the passage of the four rural school bills known as the Cole Bills together with an explanation of just what bills are and what they will do.

There are no doubt some features of the new rural school laws which may not work out satisfactorily. If so, they can be amended and properly changed. On the whole, this is the most constructive rural school legislation that has been put on the books in a generation. It leaves the situation entirely in the hands of local people, it relieves rural school taxation in those districts where help is most needed and it enables local people to take advantage of real opportunity to improve their schools.

The air has been filled with demagogic, unfair and misleading statements about the various suggested bills to help farmers with their local schools. It is impossible to get any legislation that will please everybody, but minor points and matters that could easily have been adjusted, had they worked out wrong, have been picked out and jumped upon, while the good features of proposed legislation, features which would have both helped farmers to improve their schools and reduce local taxation, have had no fair support or explanation by those who opposed the legislation.

All that **American Agriculturist** suggests is that you first study the new Cole Rural School Laws, and then give them a fair try-out, after which such changes and amendments that seem to be necessary can be made. Note in particular the explanation in the article on this page showing how the Cole laws will reduce local taxes.—The Editors.

realize that it was very doubtful whether there would be any rural school legislation passed during this session, and we thought that unless great care were taken, if any such legislation were passed, there would be danger that it would do more harm than good to the interests of the rural school patrons and their children. Accordingly the **AMERICAN AGRICULTURIST** called a conference to talk over the matter at the Ten Eyck Hotel in Albany on December 18th. This conference was attended by representatives of the leading farm and educational organizations of the State, and some of the representatives of the legislature. The editor of **AMERICAN AGRICULTURIST** was chosen chairman.

After an afternoon spent in discussion, it was voted to request the legislative committees on education in the Senate and the Assembly to draft a rural school bill or bills which should include a few stated fundamental principles for rural school improvement, including especially a larger and more equitable distribution of State money for the aid of rural schools coupled with a provision that there should be no consolidation of any district or rural schools without the consent of the patrons of

the individual districts. The chairman of the meeting was also requested to call another meeting early in the legislative session to follow up and support this desired legislation for rural schools.

Those Who Favored The Cole Bills

Accordingly, the **AMERICAN AGRICULTURIST** called another conference in Albany on February 2, 1925, at which the following organizations were represented: New York State Grange, New York State Farm Bureau Federation, New York State Home Bureau Federation, the **AMERICAN AGRICULTURIST**, the State College of Agriculture, the State Horticultural Society, the State Teachers' Association, the Associated School Boards and Trustees, the State Education Department, the State Council of Superintendents, the State Associated Academic Principals the State District Superintendents' Association, and Honorable Ernest E. Cole, and Honorable Leigh G. Kirkland, New York State Senators. Both Senators Cole and Kirkland were members of the Senate Committee on Education. The editor of **AMERICAN AGRICULTURIST** was again chosen chairman of this conference.

Principles Agreed Upon

All of the afternoon was spent in a discussion of suggestions for rural school legislation. The widespread interest and appreciation of the importance of the problem can be seen by the character of the organizations and their representatives who took the trouble to travel across the State to attend this rural school conference. There was but one desire evident in the discussions, and that was to agree upon principles that would work for the benefit of rural people and that they would approve.

As a result of this conference, the principles stated below were unanimously adopted. That so many different organizations and individuals representing so many different points of view favored these principles show that they must be right.

1. *We favor extension of State aid to adjust the inequalities in local taxation.*

2. *We recommend a provision for a larger local unit of taxation, OPTIONAL IN FORM, coupled with a larger State offering, either by an amendment to the present law or by new enactments.*

3. *We recommend State aid for tuition and transportation for pupils above the sixth grade when sent to approved schools.*

4. *We favor additional State aid for training classes.*

In connection with recommendation number three, it should be explained that it was not the thought of the recommendation to require pupils above the sixth grade to be sent to other schools, but simply to help them with tuition and transportation when they desired to go to higher schools.

Indebted to Senator E. E. Cole.

To carry out these recommendations four bills were introduced in the legislature. These bills came to be known as the four Cole Bills. The only recommendation that was not covered by these bills was number three. It seemed wise, after careful consideration, not to press for State aid for tuition and transportation of seventh and eighth grade pupils until the plan which was finally adopted for extending State aid to adjust inequalities of taxation had been put into operation.

The four Cole Bills took the name of their introducer, Senator Ernest E. Cole, of Bath, Steuben County, New York. As we stated above, Senator Cole, who was Chairman of the Committee on Education in the Senate, attended the conference called by the **AMERICAN**

(Continued on Page 402)

The profit start

WINNING sportsmen always keep in mind the old proverb, "A good start is half the victory." And wise farmers do likewise—

To start well—to show an increase in your income this season—you must be sure that you are using a fertilizer that will bring best results.

Other farmers' experiences will help you in deciding. Read the following, for example—

In Kent County, Michigan, Mr. N. Koster grew celery on four adjoining plots. The soil was muck with marl subsoil. His yields showed that 1000 lbs. per acre of a 2-7-10 resulted in \$122.40 more income than when the same fertilizer minus potash was used.

Mr. Koster's experiment with celery on muck soil showed that potash costing \$6.00 produced \$116.40 extra net income per acre.

The New York Experiment Station is recommending 1000 to 2000 lbs. per acre of a fertilizer analyzing 4% nitrogen, 8% phosphoric acid, and 10% potash.

See that your dealer supplies you with a fertilizer containing plenty of potash. Potash Pays!

Prompt Limestone Shipments

BECAUSE of our large pulverizing and sacking facilities, you are sure to get prompt shipments of
MICHIGAN LIMESTONE
GUARANTEED 99% CARBONATE OF LIME

To save extra handling, many farmers like to haul limestone direct from car to field—with Michigan Limestone this is possible to a large extent. Last spring, in the month of April, we shipped more than 50 carloads each day during the rush season, without working nights. It is safe to expect that we can load and ship from 70 to 80 carloads of Michigan Limestone daily during April if the demand requires us to do so. Thus you can depend upon getting Michigan Limestone just when you want it.

How Long Weed Seeds Live and the Damage They Do

W. C. MUENSCHER

HAVE you ever sown a certain crop upon a piece of recently plowed pasture land, grass land, or even upon land that has been cultivated during the years immediately preceding, and a year or two later noticed the appearance of certain weeds which apparently did not occur there before? Perhaps these weeds were unfamiliar to you and you wondered how they got into your field. Many farmers have had the same experience. Most, and perhaps you too, have blamed the seed, thinking it was unclean and therefore responsible for the appearance of these "new weeds." It is entirely possible that this was the case and no doubt this is the manner in which weeds are often scattered into new areas.

It is also possible however, that the "new" appearance of the weeds is due to weed seeds that had been buried in the soil where they had been lying dormant for many years. In New York State every year a number of weeds are reported as new introductions with impure seed in spite of the fact that records are available indicating that these same weeds had been introduced and were of rather common occurrence in the same general region at least twenty or thirty years ago. It is possible, and highly probable, that many of the so-called "first" appearances of weeds are due, not to impure seed, but to the seeds which were inactive but preserved in the soil as long as they remained buried or undisturbed. When these seeds were brought near the surface of the ground they germinated.

Some Long Time Records

Some experiments with buried seeds conducted by the Michigan Experiment Station and also by the United States Department of Agriculture over periods of from twenty to forty years, have revealed a remarkable longevity in many common weed seeds. It is not uncommon for weed seeds to retain their germinating power ten, twenty, or even forty years after they have been buried in the soil. Here are some examples of common weeds, followed by the number of years their seeds were buried without losing their power of germination. Wild or black mustard, Pigweed, Purslane and Redroot germinated after having been buried from twenty to forty years. Canada thistle, yellow foxtail, small ragweed, Jimson weed, Ox-eye daisy and nightshade germinated after having been buried twenty years. Chickweed, Buckhorn plantain and Hedge mustard germinated after having been buried ten years.

Weeds Produce Large Numbers of Seeds

It is a generally known fact that most weeds mature enormous numbers of seeds every year. A single individual of some of the worst weeds may produce enough seeds in one season to cover an entire acre of ground if they all developed into plants during the next season. For example, single plants of some common weeds growing about Ithaca, N. Y., matured the following numbers of seeds in one season: Hedge mustard, 511,208 seeds; Fleabane, 243,375; Prickly lettuce, 52,700; Nightshade, 178,000; Jimson weed, 23,400; Purslane, 193,213.

One plant of hedge mustard produced over a half million seeds, or enough, if they were evenly scattered, to sow eleven seeds on every square foot in an acre of land or enough to sow 3200 seeds on every acre of a 160 acre farm.

Sowing Clean Seed Is Important

Considerable emphasis has been placed, especially in more recent years, upon the desirability of sowing clean seed in order to prevent the introduction of noxious weeds upon farm land. This is a step in the right direction. Every effort should be taken to insure the farmer

Permanent Improvements at Low Cost

You can cut the cost of concrete work practically in two by doing these jobs yourself with a

Handy Farm Mixer

Thoroughly mixes wheelbarrow load per minute. Eliminates back-breaking hand mixing. Keeps each batch clean from dirt. Fully meets the need of covering every particle of sand and gravel with coating of cement to insure high grade concrete.

Putting in walks, steps and foundations; laying feeding and well platforms; hog, chicken house and stable floors; besides mixing feeds and washing root crops—these are some of the many uses to which you can profitably put this labor-saving, money-making equipment.

Durable, long-lived construction is combined with a low price. Furnished as hand or power machine, with or without portable truck. Unmounted or portable machine with light engine power.

See the Handy and get prices at your John Deere dealer's. Write John Deere, Moline, Ill., for literature fully describing this machine. Ask for booklet HM-63

What Causes Pear Scab and How to Control It

We have a Russet pear tree, medium in size that bears an excellent crop every year. However, the fruit is not perfect, being quite scabby. Some years the fruit is completely covered, ruining the crop. At times the infection even goes to the core. Will you kindly let me know what to do to stop this?—C. F. S.

From your description the trouble with your pears in pear-scab. After blight, scab is the most prevalent disease of the pear in most pear growing regions. It attacks the pear of all ages from the youngest to the oldest plant. Twigs, leaves, flowers, and fruit suffer. The name scab describes the disease at maturity very well. Black, canker-like lesions spot the fruit, leaf, and twig. On the fruit the scabs first appear as olive-green velvety spots. The young fruits so affected may drop, but if they persist, growth will be retarded or may cease entirely. The skin cracks and the fruit becomes distorted. The fruit-stalk is often shriveled. Scab is less conspicuous on the twigs and, there, usually appears as small round spots.

Caused By A Fungus

Pear-scab is caused by a fungus. The organism passes the winter in the fallen leaves or on the twigs. In the spring, spores which have matured are discharged, and, being very light, are scattered by the wind. Many reach the opening flower—and leaf-buds. Moisture and heat conditions being favorable, these spores germinate and infection is started. New infections continue throughout the growing season. The black scab spots on fruit and leaf are corky layers of tissue formed to heal the wounds made by the fungus which has ceased to grow vigorously in these scabs. The infection may extend clear to the core of the pear. Scab may be the indirect cause of pears rotting at the core. Badly scabbed fruits frequently crack open, thereby affording an opening for various decay organisms. When the outside surface of the fruit is not affected, softening at the center indicates only the early breaking up of the flesh tissue. Granular substances or grit cells found at the cores of many varieties of pears are peculiar to the internal construction of these fruits and not necessarily connected with scab in any way.

Control Measures

Different varieties of pears vary in their ability to resist the scab fungus. Flemish Beauty and Summer Doyenne are particularly susceptible to the disease. Pruning off badly infected twigs and plowing under scabby leaves are good sanitary measures. Two applications of lime and sulphur at summer strength, if applied annually, are very effective control measures. The first of these applications should be applied when the blossoms show color but before they open, and the second after most of the petals have fallen. Damp, warm weather greatly favor the spread of the disease. In such a season it is advisable to make a third application of the spray about two weeks after the second.

The Fruit For Everybody

The grape is the fruit for everybody, no matter whether time can be given to care for fruit or not. This fruit will grow and produce anywhere in almost any soil and with no special care, almost like the wild grapes of the woods. Of course care produces better fruit and more of it but it will give us exceptional returns without such care. A vine will grow over a window, on an old tree, on the line fence, on a post or trellis, or any place that you have room to stick it and the crop of fruit will come as certainly as the grape season four years out of five. Two years from the planting of the vine you will begin to gather fruit and you can continue to for years.

—L. H. Cobb.

Tractor Truths

Even the sturdiest of tractors will balk, get overheated, refuse to pull, unless the very best motor oil is used.

Socony Motor Oil is especially adapted for tractors. Whether used with Socony Gasoline or Socony Kerosene as fuel, it develops the utmost in pulling power. It stands up against heat. It gives the maximum compression seal.

And, best of all, it can stand a lot of punishment under even the most "killing" conditions.

Consult the Socony lubrication chart below for the proper grade of Socony Motor Oil for your tractor. The nearest Socony dealer will be glad to quote you prices in metal 30 or 50-gallon drums, with faucet. It costs no more, and it is mighty convenient.

Remember that SOCONY is "Standard"

SHULL FARM, Box 5, Tullytown, Bucks Co., Pa.

A Modern Patriarch

(Continued from page 385)

Paul could always sell his wheat—or a yoke of fat steers that journeyed to Albany on their own feet or two or three fat hogs slaughtered and drawn there on a sleigh when winter came, but upon the whole the problem was to maintain a great family almost wholly from within the fence lines of the farm. I doubt if Paul at the best ever knew a gross income of a thousand dollars per year—more likely it was half of that and yet it was enough and to spare. Always there was a prodigal abundance of simple, wholesome food. Always there was flour from Paul's own wheat ground under buhrstones turned by the wooden overshot water wheel on the creek two miles away and the miller took his pay in "toll"—one bushel out of every ten for grinding. Of course, the flour was not as white as that which flaming billboards assure us we will use "eventually—why not now?" but it was as good as any of that time. My father who through many years told me many tales used to relate how sometimes boiled eggs crowned the family board and how a great milk pan full of them passed up and down before those hungry boys. It was not elegance but it was abundance and a feast. I can imagine Paul's merry scorn if he could have visualized the modern "kitchenette".

* * *

Always hanging in the smoke house or later buried deep in oats were fitches of bacon and nut brown hams and in the cellar barrels of beef and fat salt pork and ample bins of potatoes and the fruits and vegetables of the old time, self-contained farm home.

Moreover, the farm was a manufacturing establishment, an industrial community where thrift reigned and where there were no strikes and no lockouts. Month after month throughout the year, each farm task in turn was taken up and accomplished and set aside even as with the peaceful years came springtime and harvest and the winter snows. When March came and the snow lay only in patches along the fences and on the north slope of the hills, they "tapped" the "Sap bush" with wooden spiles and wooden buckets or hewn wooden troughs and of the sugaring made at once a harvest and a revel. In July Paul's wheat bowed heavily with its ripe burden and his stalwart sons laid it low with rhythmic sweep of cradles while others following behind bound it with sheaves with twisted bands straw and the same knot used by harvester folk since immemorial days. When Autumn came and the husks grew yellow on Paul's corn, he and his sons built it into orderly array of shocks that suggested a tenting army keeping watch over the field and later with a husking-bee made a neighborhood festival they brought the gleaming gold to crib. On sharp and frosty winter days was heard the muffled, measured beats of flails on threshing floors and always the mountain of wood beside the kitchen door grew even higher as the winter passed.

* * *

Each springtime Paul's little flock of sheep were first "washed" in the farm brook and then sheared and at the "carding mill" a few miles away their wool became great soft, fleecy bundles of "spinning rolls". Each May Paul sowed a plot of flax which in blossom time became blue as the sky above it and later was pulled and retted and hatched and spun by primitive art.

It was a huge overflowing family but without and within there was useful work for everyone and each member played their part in the well-ordered farm economy. So Adam delved and Eve spun and within the house the spindle sang and whined and snarled and the hand loom clanked and thumped as it drove home the wool into thick and honest cloth of home grown linen or Virgin wool so that Paul's family

might not lack for raiment that was decent and fit.

So too, the calves and fat cows which yielded meat gave also skins which at the neighborhood tannery under the primitive yet very skillful art of the time, became wonderfully soft and durable leather for harness and also for boots and shoes, shaped by the itinerant shoemaker who often carried his tools with him and worked beside the fire of his employer.

* * *

I like to think that every father was a man with a wide knowledge of the worth while traditions of a rural neighborhood. I suppose that I was only a little lad when he first told me of Paul and I am sure that often I asked to have the tale repeated and now I have lived to see new chapters written into it. Always as I have reviewed his career, it is impressed upon me that he was a simple, primitive, untrained, and yet withal a wise, foresighted man.

And so it was that the years came and went, he remarked the mighty line of sons almost thronged his house and as a wise father ought he planned and debated much what he might do in order that these boys might have each his place in the sun and that they might come to be an honor to him and his race.

So at length out of his long musings, he evolved this wise, just plan. As each son came to manhood and according to the custom of the time, took a wife from some neighboring farm and was ready to begin for himself, Paul purchased a farm somewhere in the convenient neighborhood, paid down a thousand dollars on the price, then established the boy upon it and bade him make good for the rest.

* * *

So one by one as his boys came of age, Paul followed out this established policy so scrupulously fair to each. I take it that it was from sixty to eighty years ago when Paul was setting up his boys. It was a day when America was on the whole agricultural rather than industrial and there were few outside calls to tempt these boys to leave their native township.

So when after many full and fruitful years, Paul at length laid down his good gray head. I think he must have departed cheered and comforted by the thought that he had done well by all his boys and that his dynasty was secure for all the generations to come. Also, I like to remember that he must have felt a certain pride in his name because to "young Paul" (the one I knew) he left the old home farm. And thus it was that in my boyhood you could drive along the pleasant roads that wind among the hills in the leisurely fashion characteristic of the region and you would note that these sons of Paul made up the "neighborhood". My thought—my memory of them—is that they were pleasant, kindly blonde-bearded men deemed a little slow of speech, perhaps of wit. The point—the moral of my tale—if such there be, is that not one of them could fill his father's shoes. One or two of the grandsons of Paul still hold their farms with feeble, slipping hands, but most of them are forever strangers to the region which was the cradle of their race.

* * *

It would add a fine thrill to my story if I could tell how today there are boys sprung from that old rural stock who have made great places for themselves in the world as Captains of industry or leaders and teachers of men. I cannot pretend to remember all of them nor have I painstakingly followed their careers, but now and then some incident again revives their memories.

There must be in the world a very considerable number of men whose an-

age limit is 18—under rules and regulations to be established by the state commissioner of motor vehicles. The holder of a junior operator's license may not operate in a city of 1,000,000 or more population, and may operate only in traveling to and from school "or in the usual and ordinary pursuit of the business of parent or guardian of the licensee". Application for a junior operator's license must include either a birth, baptismal or school certificate, and an affidavit signed by the parent or guardian, setting forth the facts showing the necessity for the license. The only difference between the two bills is that the Kirkland-Fake measure also provides that the licensee may operate only between sunrise and sunset.

The Republican measure to bring about a change in the management of the state fair passed both houses and is before the Governor. Democrats wanted the management of the fair put in the hands of the commissioner of agriculture, but the Republicans insisted on a bill placing the management in the hands of the state council of farms and markets which will appoint a manager for the fair. The bill, as passed, also provides that the state fair commission shall continue its activities during the present year and shall not turn over its affairs to the council of farms and markets until January 1, 1926. This legislation was brought about as a result of claims by Lieutenant Governor Lowman, who is ex-officio chairman of the fair commission, that he had found the financial affairs of the commission "in a mess."

Legislation of special interest to farmers and the rural sections, which failed of passage, includes:

Bill to abolish the state council of farms and markets. This is an annual Democratic measure, and did not get out of committee this year.

Bill to establish a division of rural hygiene in the state department of health, and appropriating \$10,000. This bill was introduced by Senator Kirkland and Assemblyman Frank H. Lattin, Republican, of Albion, and died in committee in both houses.

Bills to impose a gasoline tax. Two major propositions were introduced, one to fix a tax of one cent a gallon on all gasoline sales, leaving the present registration fees as they are, and the other to make the gasoline tax two cents a gallon and fix a flat registration fee. Neither bill was reported out of committee.

Farm Legislation in New Jersey

New Jersey farmers fared well in their organized legislative program this year. Eight laws were added to the New Jersey statutes as a result of the efforts of the New Jersey State Federation of the County Boards of Agriculture and the New Jersey State Grange, which, through their Joint Legislative Committee of which Dr. W. H. Whiton of Somerset County, N. J., is chairman, introduced and backed the desired measures during the 1925 legislative season. Five other measures, and later an additional bill substituting one of them, were prepared and advanced in the Legislature but fell by the wayside.

One of the principal agricultural bills becoming a law is a provision in the insurance laws which now authorizes farmers to organize mutual insurance companies for the writing of their own risks. This is a measure the farmers of New Jersey have fostered for several years. The new law comes as the result of hard work and perseverance on the part of the agricultural leaders who are behind the legislative program of the Farm Bureau and the State Grange.

Among the other farm laws is a change in the Milk Dealers' Licensing and Bonding Act, which adds enforcement provisions to the present law and makes possible its effective administration. The situation on the poultry quarantine and European fowl plague this last season gave rise to two measures which offer protec-

tion to poultrymen in New Jersey. In addition to protective features, the new laws authorize a modest appropriation for use by the state poultry authorities in studying the disease and for the working out of ways and means to prevent its recurrence in any disastrous way in the state.

The fight for the control of bovine tuberculosis in New Jersey, which has been backed by the organized farmers for several years, seems to have an added stimulus this year in a law secured for further appropriation to be used by the New Jersey State Bureau of Animal Industry. Another live stock measure brought to a head during the season increases the penalty upon owners for damage incurred by a roving bull. This matter had the backing of dairymen and live stock men throughout the state and is considered an important move in protection of the pure-bred industry in the state.

Another law secured by the farm interests amends the statutes to the end that dogs may be allowed to run at large upon the property of their owners, clearing up a situation for farm owners who have always held that they had the right

McCormick-Deering Corn Planters

CHECK ROW • DRILL • HILL DROP DRILL

When you plant your corn you plan for the greatest possible yield. To get this you must use every available foot of land. You must *grow a full hill everywhere a hill is supposed to grow*. If your corn planter has passed its most useful days, you cannot do this. Missed hills can easily cost you several hundred bushels each year.

Right now the McCormick-Deering dealer in your community is ready to show you new, dependable McCormick-Deering Planters that will help you avoid losses from missed hills. Features: variable drop; edge, flat, or full hill drop plates; automatic markers, power hill drop; all standard widths; fertilizer attachments; and pea and bean attachments. One of these planters can easily pay for itself this year out of the money it saves.

McCormick - Deering Cultivators

STYLES AND EQUIPMENT FOR EVERY KIND OF ROW CROP

Never before has the value of the two-row cultivator been so evident. This year every short cut must be used, yet the farming job must be done better than ever. You can do this with a two-row cultivator. If you wish, you can go over the corn an extra time or two, yet your labor cost will be considerably less than your usual cultivation with a one-row cultivator. In fact, the points in favor of two-row cultivation are so numerous that you will surely wish to talk to your local McCormick-Deering dealer about the light-running, easy-to-handle McCormick-Deering two-row cultivators. Ask him also about McCormick-Deering one-row corn cultivator. Let the tools in the McCormick-Deering line help you.

INTERNATIONAL HARVESTER COMPANY

606 So. Michigan Ave. OF AMERICA (Incorporated) Chicago, Illinois
 93 Branch Houses in the U. S.; the following in American Agriculturist territory—Albany,
 Auburn, Boston, Buffalo, Elmira, Harrisburg, Ogdensburg, Philadelphia and Pittsburgh

will climb flights of stairs to tiny cubicles within brick walls and they buy ham by the slice and milk in a bottle and potatoes in a paper bag and have quite forgotten how Paul planned that always they should walk between their own plow handles and turn over the brown earth in the spring sunshine.

Frequently, I pass Paul's old farm. Since his day it has known other owners and on the whole it has prospered. On the site of the low, spreading, old-fashioned wood colored barn where once Paul beat out his wheat with flails, has arisen a great, new towering barn with acetalene gas lights and iron stable equipment and milking machines and big decorative galvanized iron ventilators rising above the gambrel roof, Paul's substantial dwelling still stands—better kept than of old.

A Modern Patriarch

(Continued from opposite page)

cestry runs back to Paul but almost none of them are farmers.

They are working out their lives as one of thousands in giant factories or turning switches in busy railroad yards or whirling the control lever on grinding, banging trolley cars. They are waiting—waiting for five o'clock and the whistle. And when it blows they will take their dinner pails and go home to a rented home on some side street or

property when not in conflict with game and hunting provisions.

The efforts of the Farm Bureau and the State Grange through their Joint Legislative Committee, following the annual legislative conference early last Fall when all farm interests in the state took part, brought splendid results this season to the credit of both organizations and their Committee. It is very apparent, however, that more continuous and energetic support is needed from the "man back home."

So I have been writing not of an abandoned farm but of a wandering family. And tonight as I muse and picture to myself the patriarchal life he led, I wish that I might have done homage to King Paul in the far off day when he was the wise, just, firm ruler of a Farm Empire all his own.—Jared VanWagenen, Jr.

Announcing the **DE LAVAL** Junior Milker Outfit For Milking Small Herds

OWING to the remarkable success which De Laval Milkers have attained during the past nine years in saving time and labor, increasing the production of milk and improving its quality, as well as eliminating the drudgery and dislike of hand milking, there has arisen a widespread demand for a De Laval Milker for milking small herds.

In response to this demand, the De Laval Junior Milker Outfit has been designed and is now offered to small herd owners. Every user of this outfit can expect exactly the same satisfactory results as the thousands of other De Laval Milker users in this and all dairy countries of the world are obtaining, for it is exactly the same in operation as the regular De Laval Milker

and differs only in that it has a Pulso-Pump and Trap of smaller capacity.

The De Laval Junior Milker is sold complete with one standard De Laval

Unit and enough hangers and cocks for a 10-cow installation. It is designed, however, to operate two standard De Laval Milker Units when so desired, with an installation not exceeding 60 feet of pipe, and will milk as many cows as can be stanchioned within these limits.

This outfit can be operated by a $\frac{3}{4}$ hp.

electric motor or a $1\frac{1}{2}$ hp. gasoline engine, making it economical in operation.

At any later date should the owner of such an outfit increase his herd, the capacity of the milker can always be enlarged accordingly, at comparatively small expense.

\$175.00*

for the Complete Outfit as shown above (except piping) consisting of

1 No. 37 Pulso-Pump
1 Junior Trap
1 Vacuum Controller
1 Complete Milker Unit
And enough hangers and cocks for a 10-cow installation.

Capable of operating 2 units within a 60 ft. installation.
*Slightly higher on Pacific Coast and in Western Canada.

What Dairymen are Doing Buying Tested Cattle---Treating Abortion

IT seems as though there is still considerable doubt on the part of cattle owners who are endeavoring to eradicate bovine tuberculosis from their herds as to what precautions are necessary to prevent the re-entry of disease in their herds when purchasing animals. According to the accredited herd agreement under which the majority of the men are operating, nothing but tested animals can be added to the herd after the first test and the addition only being made after the animals have passed at least two tests with negative results.

Too much dependence can be placed on an accredited herd certificate although it should be the first question when considering the purchase on animals from a herd that the buyer is not familiar with. Notwithstanding the fact that the tuberculin test is as well perfected as we can expect at this time and the fact that the working out of the accredited herd plan is a systematic and efficient way of combating the disease, the very nature of the disease itself lends it to be very readily introduced into even accredited herds in a very short time. Cases often arise where animals from accredited herds react to the test.

Demand Additional Guarantee

The best solution seems to be at present for the buyer to demand additional guarantee from the seller besides the fact that he has a certificate covering the herd. The larger cattle men are pretty apt to avail themselves of the sixty day retest agreement—and certainly each and every man who is trying to build up his herd should do likewise. This is matter that is fairly easy to arrange at the present time and in view of the number of cases where animals do react on subsequent tests even after accreditation, it certainly should not be overlooked by anyone in New York State.

The tuberculin test is but one step in the process of clean herds, and is only one of the minor ones. Cattle owners must give some thought to the future in keeping out reactors in the future.

—D. V. RIVENBURG.

To begin with the stables must be so constructed as to allow plenty of sunlight to enter and to be sanitary in every way. Good ventilation is essential. The frequent use of the hose to wash out the stable keeps it sweet and clean. Good bedding for the cattle is necessary. All cleaning and sweeping should be done before the milking, never while it is going on.

The cows should be clipped on flanks and udders, and groomed at least once a day. Always wash the tails, flanks and udders before milking. It is best to use warm water for this. No cow with a bad quarter or udder should be with the milks cows. **KEEP SEPARATE.** When starting to milk always milk a few squirts from each teat into (not on the floor) a special pail provided for this purpose. This milk can be fed to the calves.

After the milk is drawn from the cow it should be taken direct to the creamery and cooled to at least 50 degrees F. Never allow the milk to stand in or near the stables. After cooling it should be bottled and capped at once, preferably by machine, then placed in a cooler where the temperature is at least 50. When the bottles and utensils have been washed thoroughly, place where they can be sterilized with live steam. After the steam has been turned off keep them here until ready for use.

All the afore mentioned ideas call for extra work, extra help, and extra equipment. But if one expects to produce certified milk, which is a superior product, one must expect to use superior ideas and methods.—L. D. HUGLEY, Pennsylvania.

Handling A Case of Abortion

Last spring I had two cows that lost their calves. This spring I have had three so far. Would you please tell me if this is a disease? I feed them hay twice a day and oats and barley straw once a day. They have a good stable, well ventilated, also water in the barn.—J. B. C., New York.

YOUR question raises the whole question of how to properly handle a herd where the cows are aborting.

It is the general experience that cows that lose their calves once may lose them again and also that there is always a great deal of trouble in getting them in calf because infections of one kind or another usually follow an abortion and it puts the breeding organs of the cows in bad condition.

Therefore, when a cow aborts I do not think it worth while to try to carry her on as a breeder in the herd unless she is especially valuable. I think the best thing to do is to get rid of her as quickly as possible.

(Continued on opposite page)

Producing Certified Milk

PRODUCING certified milk under ordinary conditions is a hard and laborious task. A special effort must be made to keep down the bacteria by having clean sanitary conditions; careful consideration of details is another factor that enters into the scheme to a large extent, but the main idea is the assimilation of cleanliness in the handling and the caring for the milk.

H. H. Buckley, owner of Cathedral Farms, Oneonta, New York, mourns the loss of a pure bred Guernsey cow that only dropped him two heifer calves before she was accidentally killed. And well he may, for the two heifers have both become class leader cows, the last having the distinction of being one of the three 800 pound Guernsey two year olds.

The old cow was Shamrock and Lena's Kate S. 64428. Her first daughter was Kate of Fairview 82754, (above) who took fourth place in class B last year, with a record of 19227.8 pounds of milk and 905.65 pounds of butter fat. The second daughter, Cathedral Kate 126395, has just completed a record of 16339.8 pounds of milk and 801.13 pounds of butter fat in class G, the junior two year old section, which makes her the third highest producing cow in the breed for her age.

Pay for a Harder Out of Your Milk Checks

A silo is almost as necessary as a milk pail on the dairy farm. And if you have one silo, you probably need another—for summer feeding and reserve. Shrewd feeders are using less grain and more silage—they find it pays better under present conditions.

You can't control the price of milk but you can largely control your feeding costs. A Harder Silo will help you show a profit and you can pay for it mostly out of your milk checks.

It's made of the best Spruce or Oregon Fir, cut with beveled edges and square tongues and grooves to make a perfect fit. Then it is doweled and sealed to make it rigid and air-tight. Goes together so easily no skilled labor is needed to put it up. And once up, you have the best silo in the community—with the patented Harder-Victor Front.

Write for our easy-payment plan and free book, "Saving with Silos." Let us show you how to reduce your feed bills, increase your milk flow and add extra dollars to your bank account.

HARDER MFG. CORP.

Box F

Cobleskill, N. Y.

HARDER SILOS

Now for constructive measure: (1.) I should put the herd in the hands of a competent veterinarian and be guided by his suggestions.

(2.) I would have my bull thoroughly examined because I think that many times the bull infects the cows in the herd even though he is apparently a good breeder.

(3.) I would have each individual cow in the herd examined before breeding and breed them under the supervision of a veterinarian.

(4.) I fail to see how any one can hope to cope with this disease without the help of a veterinarian who understands the nature of the disease and is interested in working with a breeder to help him overcome it.

(5.) In a choice of a veterinarian I would be sure that he had had experience and was well qualified to work on this disease.

(6.) With respect to the nutrition of the animals I earnestly suggest that where breeding troubles are being met with that a man should lime his land and do his level best to provide good legume hay, early cut clover or alfalfa, for all of his cows and that in addition he give them what they will eat of the following mineral mixture: equal parts of steamed bone meal, ground limestone and salt. Four ounces a day should be sufficient. In summer when on pasture cows should have access to this mineral mixture.

Singleton Herd to be Dispersed

ONE of New England's good Holstein herds will be dispersed when S. T. Wood of Liverpool, N. Y., sells the J. Ernest Singleton herd at Wallam Lake, R. I., on April 18th. The herd is largely of Colantha breeding, many of the females tracing back to an excellent daughter of Colantha Johanna Lad, used as a foundation cow. Every female of milking age in the herd has an A. R. O. record with the exception of three which freshened last summer as two-year-olds. Some of the individuals particularly worthy of mention are Princess Copia Alcartra who made 31 lbs. at three years of age, the 28 lb. Princess Evertje De Kol 4th with a year's record of 1189.8 lbs. butter and 25,966.7 lbs. milk, and a 30 lb. granddaughter of Hengerveld De Kol 5th. At Singleton Farms there have been developed state champion butter producers in all seven classes of the thirty day division, and in several classes of the yearly division.

At the head of the herd is Terracelawn Pontiac Vale, out of a 33 lb. daughter of a son of King Segis. His sire is a son of the 41 lb. sire, King Korndyke Sadie Vale. The daughters of Terracelawn Pontiac Vale have many excellent records to their credit, and including a recently completed junior four-year-old record exceeding 24,000 lbs. milk with a butter production of something over 1,000 lbs. Other daughters include many with seven day records and several with high yearly records. The junior herd sire is another Colantha bred bull, Sir Roella Colantha, whose dam has a 25 lb. four-year-old record.

In the herd are 17 daughters of the senior herd sire and 22 sired by the junior sire. Several of the herd members have been bred to both these sires. Every precaution has been taken to maintain a healthy herd with the result that it has been accredited for about two years. There has been only one reactor in nearly five years.

Pennsylvania Shorthorn Breeders Annual Sale June 6

THE Bradford County Milking Shorthorn Breeders announce that their 7th annual sale will be held at Troy, Pa., on June 6. In the six previous annual sales, cattle have been sold to breeders in 16 different states and Canada. Last year's sale proved to be a bargain counter event. Those who were present secured extreme values for their money.

Building Barn Equipment For 58 Years

William Loudon is the pioneer builder of Barn Equipment. Every piece of Loudon Equipment that goes out to the farmer and dairyman must meet his rigid requirements for absolute quality. It must be designed right to do its work perfectly. It must be built so well that there will be no question about its giving full value—and more, for the money it cost. He established this iron clad policy back in 1867 and has adhered to it strictly for these 58 years.

YOU CAN DEPEND ON LOUDON

These reliable Loudon Barn Equipments are sold through reputable dealers everywhere. Old friends and acquaintances are most dependable and you have probably known your local Loudon Dealer for many years. He must sell you equipment that will give complete satisfaction—he knows you personally and counts on you for future business. He has a reputation to sustain—he sells Loudon Barn Equipment for the very good reason that he can depend on it absolutely and so can you.

Give your Loudon Dealer the opportunity of quoting prices on any of the following Loudon labor-saving equipment you may be needing to make your herd more comfortable, more healthful and more productive: Steel Stalls and Stanchions, Steel Pens, Manure Carriers, Feed Carriers, Feed Trucks, Water Bowls, Cupolas, Ventilators, Bull Staff, Hay Unloading Tools, Barn and Garage Door Hangers, Steel Hog House Equipment, Hog House Roof Windows, etc. Get in touch with the nearest dealer below:

MICHAEL LUX, Woburn, Mass.

Fighting The Hog's Enemies

A Rubbing Post Will Keep Lice Away

I HAVE raised a great number of hogs and found through practical experience that many of the troubles in the hog raising business can be traced directly or indirectly to one or two parasites, the hog worm or the hog louse. The hog house is the most common, in fact it is in every herd of hogs unless means have been taken to eradicate it. The worm of the stomach and intestines were one time a serious enemy of the hog, but this question is practically solved nowadays by the good worm remedies on the market at the present time.

The louse multiplies so rapidly that where one first notices them (one or two) on the hog today, the whole herd will be infested with them within ten or fifteen days. The first time I saw advertised a louse killer for the hog louse I bought some. It cost me twenty-four dollars, but it was money well spent. I also purchased a dipping vat, but one can be made cheaper than it can be bought. I dipped the head of hogs, and in ten days dipped them again, and I kept the feeding yard and nest disinfected with the dip. It was not a month's time and a great change could be noticed,—a change of improvement. I have tried every dip that I was able to lay hands on, and they are all good. The main thing is that a farmer or hog raiser should not let too much damage be done to the head before he used a dip or disinfectant.

A Good Rubbing Post Does the Work

There are now machines on the market which do the work much more cheaply and with less inconvenience. These machines require attention once a week or so. Just keep them full and the hogs will do the rest. If your hogs are infested with lice, and I imagine they are unless you have been working with them constantly—all you have to do is clean up their pens and bedding, thoroughly disinfect it with some good dip and place a rubbing post of some modern make in the yard and keep it filled and the whole question of the louse is settled.

Freedom of lice allows a hog to become stronger and resists diseases more easily. I have raised a number of hogs for breeding stock for many years and have not once been troubled with cholera. It is a cheaper treatment than serum, and is likely to save you that sort of investment.

Mistake with Hogs

It is a mistake to overfeed or underfeed, not to provide comfortable quarters, to forget the hog is a grazing animal, to try to raise hogs on an exclusive diet, to feed constipating food and not correct it, to feed sour milk when the young pigs are learning to eat, to feed breeding stuff as if you were fitting for market, if the hogs are not fed bone and muscle food during their growth, to

feed all sizes together, as the smaller ones are at a disadvantage, to feed a brood sow corn before farrowing when she should have laxative feed, to feed brood sows heavily immediately after farrowing, not to grow pigs rapidly from birth to market.—Roy Esser.

Care of The Scrubby Pig

FOR many years we had always on hand a scrubby pig or two and it seemed to me they just stayed that way and never grew or amounted to anything as far as profits are concerned. A change of feed never did any good that I could see. Sometimes by putting the pig away from the others, helped.

After reading and inquiring here and there I found no one seemed to have anything to offer. Of course everybody gave advice and that's a very natural trait, but advice is something like romance vs theory unless it works. A few years later I read an article in AMERICAN AGRICULTURIST also one on the same subject in another paper. We then talked the matter over and came to the conclusion that these same piggies we had been raising each year, at least one or two of them were hidebound. My conclusion was correct after visiting a large hog owner who raised several hundred each year, I was told poor treatment was one fault, and improper feeding was another, and that there was just one way to handle such a piggie effectively and that was to get rid of it, the sooner the better. That seemed terrible to me. I got to studying about this matter and hit upon a plan that has worked effectively ever since and I am sure it will work in every case where piggie is found to be hidebound.

My method is to take several gallons of water and melt soap enough in it to do the work properly. Then armed with a stubby brush and piggie cornered somewhere, he is given the washing and currying of his life even if he is stubborn, and a pig surely is. This method has worked effectively in every case. Appetite good and a fine thrifty pig is the result every time, and profitable.—Mrs. Edith Swope, Pennsylvania.

A Hint That Worked

ABOUT two years ago I wrote to you about my Fordson tractor pumping oil, and am pleased to state that I have found the cause and it's remedy. My son (who operates tractor) thinking to favor the tractor ran the motor too slowly, which caused a high vacuum that pumped the oil. Soon after writing to you I installed a governor (air friction) which has eliminated the trouble and now the tractor works perfectly.—J. J. Blewett, Pennsylvania.

"Hello, George! Funny thing, I was just thinking about you!"—JUDGE

Save TIME and WORK

The air tight, water tight doors of the Unadilla Silo cannot stick or freeze and have the distinct advantage of giving continuous opening at the level of the silage!

No more back breaking work pitching tons of silage out over your head—you simply push it out! Gravity does the rest. Saves time and work!

The door fasteners form a permanent safety ladder—convenient and secure. Hoops are easily adjusted from this ladder. No more dangerous, tire-some adjusting from easy-slipping suspension ladders.

Write today for big catalog and details of the liberal discounts for early orders and cash! They mean money saved to you! Easy Payments if desired.

In The Absence of Biddy

Where Brooder Chicks Go Wrong

TO buy day-old baby chicks is an easy start. To raise baby chicks is one of the most difficult problems confronting the poultryman. So much can be wrong; so much can go wrong in such a short space of time that a brood can dwindle perceptibly or even cease to exist over night. It would be an impossibility to set forth any rules or regulations that cover all the multitude of rising emergencies or cover all the different methods of chick raising. There are, however, a few points that are worth considering, because, in a general way, they cover a few of the things that ought not to kill baby chicks.

By L. H. HISCOCK

that of housing. There are so many different makes of stoves and oil heaters, it is not necessary to go into the details. The main thing with any brooder apparatus is conscientious care. A thermostat cannot do anything when it comes to the regulation of heat.

In the operation of coal brooder stoves there are two common faults that may affect the running of the stoves. Where a brooder house is exposed to wind and the stove pipe is four inches or larger, it is a wise precaution to put a chimney damper in the pipe; on windy days it will relieve the strain on the thermostat and keep your fire from burning too heavily. In the second place the action of cold air on the outside stove pipe, which is warm, often causes moisture. This moisture, which is a complex coal tar compound, runs down the pipe; it collects at the base or pipe hole of the stove and forms a hard mass. If for any reason, therefore, your stove fails to work properly or you seem to have trouble with coal gas in the brooder house, it is a good idea to raise the pipe and examine the stove outlet. Sometimes this deposit bakes so hard that one almost needs a coal chisel to cut it away.

Before Chicks Arrive

This brings us to the chicks. Before any chicks are put in a brooder house the heater ought to be run for a couple of days; it will give you a chance to see that it is working all right and a similar chance to familiarize yourself with it, if it is new. At the time the chicks are put in the house the thermometer, hanging down from the outside edge of the hover, should be 100 degrees. A lower temperature will result in chilling and a higher temperature in overheating; either one is apt to give serious results if prolonged for an indefinite period. This temperature should be gradually decreased, week by week, until the chicks no longer feel the need of heat.

A Good Tip About Corners

It is a good idea to confine day old chicks to the immediate vicinity of the stove. Make a ring of inch mesh wire around the brooder allowing the chicks to run a foot or two beyond the hover. It teaches them where the stove is and it also prevents them from wandering so far away that they get chilled. Every two or three days this ring may be extended and enlarged until finally the chicks have the run of the whole house. When this ring is finally removed, it is a wise precaution to box or round off any corners in the house. Chicks love a corner and they love to crowd and hover in one, much to the detriment of the poor fellow on the bottom. The rounding off of the four corners of a room tends to break up what, otherwise, would become a bad habit.

Sunshine, Cod Liver Oil and Ventilation

As regards the brooder house itself, it should, of course, be tight, but it should also be well ventilated. Fresh air is a necessity, and this means, barring the use of ventilators, that windows ought to be hinged so that they can be opened in full or in part. The more sunshine and light you can give a chick the better it thrives. In fact, it has been this very question of sunlight that has brought cod-liver oil into such prominence as part of a good many chick rations.

Cod liver oil and sunshine seem to be one and the same thing as far as their respective properties or ingredients can be analyzed. On the other hand it has also been conclusively proved that ordinary window glass destroys these valuable rays of the sun. As it is an utter impossibility to keep all the windows open in a brooder house, it seems as if the surest way to give a chick sunshine is to feed

(Continued on Page 404)

L. H. HISCOCK

The first and most important step in this whole chick undertaking is right feeding. Weak legs, sore eyes, paralysis, various diarrheas, uneven development, ruffled plumage,—any and all of these ailments are largely a matter of nutrition. Take an old hen with a brood of chicks and let her run and you eliminate all of these troubles as a general thing. Deprived of the old hen and left to their own resources, it comes down to the survival of the fittest. You cannot tell a chick what to eat and what it needs, but you must give it a ration that will supply every one of its possible needs for nourishment, growth, and general development.

"Vitals" in Feeding Chicks

This raises again the question of vitamins, a technical word that usually causes a frown. Just for the sake of argument let's call these elements "vitals." If you shoot a man in the heart, he is hit in a vital spot. If you leave a single vital part out of a chick ration, the chick is hit in a vital spot and dies. There are four of these vital elements; three of them are absolutely essential, and the other, from recent reports, is not necessary but a good element to have in a ration. The "A" vital is present in milk, eggs, yellow corn, and cod-liver oil. The "B" vitamin is found in milk, yeast, eggs, fruit, green leaves, sprouts, and the outer covering of grains. "C" is present in milk, fresh fruits, green leaves, sprouts, and eggs. "D" vitamin is present in milk, eggs, cod-liver oil, and green stuff.

Where Vitamins Are Found

From a comparison of the above vitamins you can see that eggs and milk represent two foods that contain all these elements. Hard boiled eggs ground up, shell and all, constitute a perfect chick ration, but, unless eggs are unusually cheap or you have ready access to the infertile eggs from a hatchery, their use is out of the question. Milk of various kinds is usually obtainable on a farm, but, as a great quantity must be consumed because of the high water content, milk is not really a ration but a valuable addition to be used with other chick rations.

In short, from the complexity of composition of these vitamins, the wisest and safest way to raise young chicks is: firstly, to procure a good commercial chick mash and grain; or, secondly, to advise with your nearest college experiment station or farm bureau man. Too little is said about the wonderful work that these poultry experiment stations are doing; their advice and their help are always at your disposal simply for the asking; their recommendations are based on sound results obtained by systematic research. In the last two years nothing has received so much thought and attention as the day old chick.

Next to the feeding problem comes

PAN-A-CE-A

prevents the back-sets

If you want early broilers—

If you want November layers—

You must avoid the back-sets in your growing flock.

Add Dr. Hess Poultry Pan-a-ce-a to the ration daily.

Then never mind about disease, bowel troubles, leg weakness and gapes.

Pan-a-ce-a takes care of all that.

Pan-a-ce-a tones up the appetite—promotes digestion.

Pan-a-ce-a helps your flock to turn the feed to good account—growth, bone, flesh, feathers.

You can tell a Pan-a-ce-a flock every time by the good feeling—always happy and industrious.

Costs Little to Use Pan-a-ce-a

The price of just one two-pound broiler pays for all the Pan-a-ce-a 200 chicks will eat in sixty days.

Tell your dealer how many chicks you have. He has a right-sized package for every flock.

REMEMBER—When you buy any Dr. Hess product, our responsibility does not end until you are satisfied that your investment is a profitable one. Otherwise, return the empty container to your dealer and get your money back.

Reviewing the Latest Eastern Markets and Prices

MILK PRICES

THE Dairymen's League Cooperative Association announces the following prices that dealers will pay the League during the last half of March for milk testing 3% in the basic zone of 201 to 210 miles of New York City. It is understood of course that the prices mentioned below are not received by the farmer but go into the pool. They are prices dealers pay the League.

The reduction in Class 1 amounts to 27 cents per hundred while in Class 2 the reduction is 10 cents per hundred in each class, A, B, and C. Class 3 prices remain the same as in early March.

It is reported that the Directors have voted that these new prices for the last half of March will be continued in April unless conditions warrant further change.

Class 1 Fluid Milk	\$2.80
Class 2A Fluid Cream	2.10
Class 2B Ice Cream	2.15
Class 2C Soft Cheese	2.05
Class 3A Evaporated whole milk	

Cond. whole milk	1.90
Class 3B Whole milk powder	1.85
Class 3C Hard cheese other than	

American	1.65
----------------	------

Class 4 prices will be based on butter and American cheese quotations on the New York market.

Sheffield Producers

The Sheffield Farms Producers announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$2.80
Class 2	2.10
Class 3	1.65

Class 4 prices determined by butter and cheese quotations on the New York market.

Non Pool Cooperative

The Non-Pooling Dairymen's Cooperative announces the following prices for 3% milk in the 201 to 210-mile zone:

Class 1	\$2.80
Class 2	2.20
Class 3A	1.80
Class 3B	1.75

Interstate Producers

The Interstate Milk Producers Association (Philadelphia Price Plan), announce the receiving station prices or the price to the farmer in the 201 to 210-mile zone from Philadelphia for 3% milk is \$2.19. In the 101 to 110 mile-zone, the price is \$2.29.

BUTTER DOWN AND UP

Last week the market developed a sudden reversal of form, contrary to general expectations. It came with the suddenness of a storm. General opinion indicated that the market would be upward but like all reversals it came quick and fast. Lack of buying interest was responsible for the turn. Many operators lost confidence when advances failed to materialize and sentiment changed to the point that prices were shaded to 46½¢ for fanciest marks. This represented a reduction of a cent and a fraction since our last report. As soon as the market took this downward turn, speculative buying withdrew its support. The regular channels of distribution were inadequate

to absorb the daily arrivals and the accumulation of fresh stock in first hands caused enough pressure to sell at reduced prices. No one is willing to pile up butter at this season of the year. April is upon us and the spring flush will soon be here.

The downward trend stopped on the 30th, reversed and developed a little more strength that some operators anticipated. A lot of out of town buying interest absorbed a good portion of the fresh arrivals. Enough activity was in evidence to reestablish the market at 47½¢. As we go to press the market is quiet and the feeling is conservative. Operators find no difficulty in supplying their trade with all the stock that is desired. Further advances are not expected due to the fact that the market is unsettled as it approaches the spring flush. At the moment undergrades are none too plentiful. Storage stocks are moving into the distributing channels quite freely and the market on held goods is steadily improving. Creamery butter scoring higher than extras are holding their own at 47¢ with a few pet marks bringing 47½¢. Creamery extras (92 score) are bringing 46½¢ with firsts (90 to 91 score) ranging from 44½ to 46¢. Other grades range downward to 45½¢.

CHEESE MARKET STILL FIRM

Although business has not been as brisk, nevertheless the tone in the cheese market is still firm. This holds true with New York as well as western markets. Production in New York State has increased rather slowly. Wisconsin is beginning to increase its make but it is running no heavier than a year ago. Prices out there do not warrant any heavy shipments to the eastern markets. Fancy held whole milk State flats are still worth 26½ to 27¢, while average run goods are bringing from 25 to 26¢. Average run whites are less plentiful than colored marks. Fancy fresh whole milk state flats are still bringing 24½, although there is some reports of a little price shading.

SLIGHT CHANGE IN EGGS

There has been little or no change in the egg market since our last report. If there is any change at all it is only in the fancier marks. So few people are shipping this class of goods that it has little or no application. Very few nearbys show real fancy quality. Such are meeting a fair demand at prices that range from 37 to 40¢. Comparatively few of these large chalk white lots are even worth this top quotation. The majority of nearby receipts are selling in the neighborhood of 33 to 36¢. Most of them at 34 to 35¢. There is a decided scarcity in the receipts of real fancy light yolked eggs. If a man is getting low country prices and his production will warrant close grading and candling, it will pay him to go after the market right now.

The market in general is none too strong. Heavy western shipments have been held back at shipping points to secure April dates in the warehouses and naturally with these heavier deliveries, the market has weakened perceptibly. Western storage packed eggs are quoted at 34 to 34½¢ for the very finest. In view of the unsettled condition in the market dealers have been inclined to hold off buying their holiday requirements in anticipation of a lower market. It looks as though the egg market in general has got to go lower to warrant more active buying for storage. Fanciest nearby Jersey closely selected extras are worth from 39 to 40¢, while average extras are worth 37 to 38¢. Firsts and extra firsts are worth from 33 to 36¢. The majority of arrivals are selling in this class. Nearby gathered whites are worth from 29½ to 34¢, including the pullets.

LIVE POULTRY ACTIVE

Express fowls are meeting a mighty good demand and sales are reported as high as 38¢ for fancy colored stocks. Some are ranging as low as 35¢. Leghorn fowls are generally selling in the neighborhood of 34¢. The situation in the live poultry market as far as fowls are concerned, is in the seller's favor. The freight market is experiencing quite a battle over the question of premiums which is quite common just prior to a Jewish holiday. Express broilers are coming in a little more freely. Fancy colored spring broilers are worth 60¢ while Leghorns are bringing 55¢.

Passover, will be celebrated. All kinds of live poultry of prime quality will be in demand at this time. The best market days will be April 12, 13 and 14. In view of the fact that the 14th comes on Saturday, it will be well to time your shipments so that they are received on either the 12th or the 13th. Saturday is usually a short day in the market, and if last minutes receipts are heavy it may be that returns will not be satisfactory as on either of the earlier days. Just because this is a holiday, it is no excuse for trying to palm-off some mediocre stock. An occasion like this calls for quality and the price is readily paid.

NO CHANGE IN POTATOES

There has been no material change noted in the potato market as far as old crop potatoes are concerned. Prices go about the same as they were in our last report. The new crop is rapidly expanding. Southern potatoes are no longer quoted in two figures. The fanciest Florida Spaulding Rose are meeting a rather slow sale at \$9.50 per barrel. A few reports mention \$10 but only in a special class. States are quoted anywhere from \$1.50 to \$1.75 in 150-pound sacks delivered. Occasionally an extra fancy car will turn \$1.85. But there are too many potatoes on the market to quote this as a regular price. Maines are bringing \$1.75 to \$2.10 in 150-pound sacks. Bulk deliveries show that States and Maines are not far apart. States bringing from \$1 to \$1.10 per hundred and Maines from \$1.05 to \$1.15. Fancy states would sell on par with Maines. Long Island are beginning to show a wider range of quality and values are running all the way from \$1.50 to \$3.25 in 150-pound sacks delivered. This is indicative of what is happening and what we may look for in the weeks to follow. Just as soon as potatoes begin to arrive spongy and showing small sprouts, it is then that the trade turns to good new crop.

In a report issued during the week ending March 28, the U. S. Department of Agriculture gives a summary of the results of a survey made relative to the 1925 acreage. Potato growers throughout the country as a whole it is indicated, will plant 4% less than in 1924. The heaviest reduction comes in the Atlantic States and the Mississippi Valley. Early crop and intermediate states show a very slight decrease. According to the Department, if the growers' present plans are followed out and the average yield of the past 10 years be secured (100 bushels to the acre). It is estimated the production will amount to 335 million bushels which would be the smallest since 1919. If the yields run as they did last year around 109 millions bushels apparently influenced by improvement in the quality of seed, it is estimated that the yield will total 383 million bushels, the smallest since 1921. The bumper crop of 1924 amounted to 454 million bushels.

NO CHANGE IN BEANS

There is no new feature in the bean market to report. Trade is very slow and the market is dragging very heavily and generally there is more or less of an easier feeling. It certainly paid to unload when trade spurted up in the market several weeks ago for prices now are beginning to shade. Prime screened pea beans are offered profusely at \$6.50 but \$6.25 seems to be the top of the trading market for fair stock. Red kidneys are still selling better than \$10 for choice marks, best packs bringing \$10.25 while common stuff ranged down to \$9.50. White kidneys are still holding at \$8.50 to \$9 but they are none too strong. In fact red kidneys are not in any too firm a position. Domestic marrows are worth from \$9 to \$10.

HAY MARKET EASIER

With 31 cars of hay at the 33rd Street yards and something like 75 unsold in the sheds, it is to be expected that the hay market will turn easier. Most of this stock however, is of the lower grades. No. 1 and No. 2 hay is not over plentiful. Most of the offerings are selling around \$22 a ton. No. 1 hay is selling anywhere from \$25 to \$26 and No. 2 in large bales would bring \$24. Light clover mixed is worth from \$22 to \$24 for No. 1, but little of it is on hand. No. 2 is bringing from \$20 to \$21. Second cutting alfalfa of No. 1 grades will sell from \$29 to \$31 and No. 2 at \$25 to \$26, while No. 3 will bring anywhere from \$23 to \$24, depending on

the size of the bale. Oats straw is worth from \$14 to \$15 and No. 1 rye straw \$15 to \$16.

MAY WHEAT REACHES NEW LOW

May wheat sold down to \$1.04½ on March 31, which is 65½¢ under the high point made on January 28. However, the market recovered considerable of this loss and closed at \$1.46¼. The future market is very flighty. It is watching the situation in the southwest very closely. Kansas and Nebraska report very dry conditions. Weather maps and reports show that storms have passed over these sections, but showers are very scattered.

Corn and oat futures broke in sympathy with wheat. The sympathy continued in the recovery. However, corn closed 2¼ to 3 cents lower while oats closed ½¢ higher. Rye broke with wheat but on the recovery increased 5¢. Russia has been buying very heavily in the grain market.

On March 31 flaxseed crushers reduced the price of linseed oil 2¢ a gallon. This may have some effect on the price of meal. Advances from the northwest state that shipments of flax from the Argentine are only about 1-3 of what they were at the same time last year. However, it is said that stocks at principal ports are less than half as large and the belief is held that the crop has not turned out as first estimated.

New York Cash Grains

Cash grain prices quoted F.O.B. New York City. WHEAT, No. 2 red, \$1.70 to \$1.72; No. 2 hard winter, \$1.60; No. 2 mixed durum \$1.60. CORN, No. 2 yellow, \$1.26 to \$1.27; No. 2 mixed, \$1.25. OATS, fancy white clipped 55 to 57¢; ordinary white clipped 52 to 55½¢; No. 2, 53¢. RYE, \$1.24 to \$1.30.

Local Buffalo Feed Market

The local Buffalo feed market is quoted by the New York State Department of Farms and Markets as of March 28 as follows, per ton:—Ground oats, \$36.30; spring wheat bran, \$24; hard wheat bran \$30; standard middlings, \$24.50; soft wheat, middlings \$35; flour middlings \$34.50; Red dog flour \$41; white hominy \$38; yellow hominy \$38; corn meal \$35; gluten feed \$37.75; gluten meal \$48.50; 36% cotton seed meal \$41; 41% cotton seed meal \$43; 43% cotton seed meal \$45; 34% old process oil meal \$39.

LIVESTOCK AND MEATS

With the coming of Easter trade, we may experience slightly better prices in the livestock market, especially for dressed spring lambs, and prime veal calves. On April 1, strictly prime live calves were worth \$15 to \$15.50 a hundred. In view of the light receipts we may see a price advance before many days. Common to good stock varies anywhere from \$9.50 to \$15. Prime lambs are bidding fair between. These would undoubtedly sell in the neighborhood of \$19 a hundred. Fair to good stuff is worth anywhere from \$16.50 to \$18. Fancy ewes are worth anywhere from \$9 to \$10. Hogs weighing up to 150 pounds vary from \$13 to \$13.25. Stock in the neighborhood of 200 pounds is worth from \$13.50 to \$13.75. These prices are quoted F.O.B. in New York or in other words delivered prices.

Country veal calves are meeting a fairly good market. Choice marks are worth from 18 to 19¢ and in view of the outlook we may see a cent or two premium a little later on. Fair to prime stuff is worth anywhere from 12 to 17¢, which shows that the market is operating on a rather wide range on these less desirable marks. Country dressed spring lambs that are heavy are worth from \$10 to \$12 each while the more plentiful light to medium marks are worth from \$7 to \$9. Live rabbits are meeting a slow trade.

A good belt dressing is made by mixing melted beeswax and neat's foot oil in the proportion of one-half pound of wax to one-half gallon of oil. Melt the wax first, then add the oil slowly, stirring it constantly to get it thoroughly mixed.

On the bedroom floor is shown Congoleum By-the-Yard No. 852—2 yds. wide. The 3-yard width is No. 4024.

Above is shown Congoleum By-the-Yard No. 812. It is made in the 2-yard width only.

You Get Guaranteed Satisfaction With Every Yard of Congoleum By-the-Yard!

A money-back pledge of satisfaction! That's the guarantee which goes with *Gold-Seal Congoleum By-the-Yard*.

And the Gold Seal (reproduced below) shows that you are getting *genuine Congoleum*. Insist that this Gold Seal appears on the face of the goods you buy.

Beautiful and Practical

All those features that have made Congoleum Art-Rugs the most popular floor-coverings in America are found in Congoleum By-the-Yard. Patterns are equally attractive, with the same very durable, waterproof surface that is so easily cleaned. A few strokes of a damp mop remove every trace of dust, dirt and spilled things.

Requires No Fastening

One of the most unusual things about Congoleum By-the-Yard is the fact that

it requires no fastening of any kind. Cementing or tacking is never necessary to hold it in place, yet it never curls up at the edges and never buckles.

The variety of patterns and colors makes *Gold-Seal Congoleum By-the-Yard* desirable—and suitable—wherever the entire floor is to be covered. It is particularly appropriate for the kitchen, bathroom, pantry, halls and bedrooms.

Note the Low Prices

Two-Yard Width —85c per square yard
Three-Yard Width—95c per square yard

Owing to freight rates, prices in the South, west of the Mississippi, and in Canada are higher than those quoted.

Why drive a shabby car ?

Three days in the creek— no harm to the Valspar-Enamel!

Trapped in the churning sandy bed of a mountain stream for three days—yet Wilfred Campbell's* car came out unscratched. Here's his story:—

"Our party was on its way into the mountains for a hunting trip when I misjudged a curve and plowed into a rough mountain stream. The car stalled deep in the pebbles and shifting bottom. There for three days it remained, all that time being rubbed and washed with gritty, sandy water.

"I had given it a coat of Valspar-Enamel and over this a coat of Valspar Clear Varnish.

"Its appearance I thought would be ruined, but it came out as handsome as ever—the wheels were not even scratched!"

That's the Valspar story whenever

* 128 E. Lindsay Street, Stockton, California

accidents occur. Valspar-Enamels give unmatched durability and service because they are Valspar itself plus finely ground pigments. Water, ice-cold or boiling hot, oils, acids, alkalies, mud, flying sand, have no effect on their hard, lustrous surface.

Valspar-Enamels are easy to use—follow the simple instructions on each can. Valspar-Enamels are economical—one quart will refinish the average small car.

Made in 12 standard colors—Red—*light and deep*; Blue—*light, medium and deep*; Green—*medium and deep*; Vermilion, Ivory, Bright Yellow, Gray and Brown. Also Black, White, Gold, Bronze, Aluminum, Flat Black.

Postscript

If you do not care to re-finish the car yourself go to an automobile painter for a professional job. In a few days and at a reasonable price he will refinish your car with Valentine's Automobile Varnishes and return it as bright and new as the day you bought it.

New York Farm News

Western County Notes by M. C. Burritt

IT has been a beautiful spring day today—like mid-April or even May. A warm sun has dried up the mud for the most part. The peepers are singing from the pond across the way. It is so warm that some of us have had a mild attack of spring fever and it's hard work to work. The land is almost dry enough to plow, especially the better drained fields, but I haven't seen anybody plowing yet. The big question in everybody's mind is, is spring really here or is this a fake? Can it be that we are this year to miss altogether the usual month of cold rains and mud? At any rate some of us are suspicious.

It has been a great week to get work done. We have sowed our grass and clover seed on wheat under almost ideal conditions, sprayed the peaches for leaf curl equally satisfactory, and cleared up a lot of brush and limb wood in the orchard. We expect to do quite a lot of pruning yet, but we are taking no chances, and cleaning up the brush as we go so that we will be prepared for an early spring if it really comes. We expect to start the plows in the orchard early next week if it doesn't rain.

More Interest in Alfalfa

A prospective seeding of alfalfa again had our attention this week. As I have mentioned in a previous news note, our county farm bureau is conducting an alfalfa campaign this year with the purpose of largely increasing the acreage of this crop in the county—a very laudable objective. Following up the first meeting in the community with a second this week, our County Agent with commendable thoroughness reviewed all the conditions which have been found necessary for complete success. In addition he added the very practical helps of testing soils for lime requirement and distributing inoculating material.

I am more and more impressed with the desirability if not the necessity of meeting all the conditions which govern a successful crop yield. I am satisfied that as farmers we all waste a lot of good money and energy by leaving undone some things which may later prove to be limiting factors. For example take liming and inoculation. Of what avail is it to secure hardy northern grown seed and to prepare a fine rich seed bed if the soil is deficient in lime and bacteria. Why risk all the extra costs on some factors for success without checking up on others?

Sampling the Soil for Lime Test

Therefore, when County Agent Merrill suggested bringing a soil sample to the meeting for test I was glad of the opportunity to do so. I took a galvanized iron pail with a newspaper in the bottom, a baking powder can, carefully cleaned out—and a spading fork, and with my young son at my heels asking questions, started for the back lot. We walked over the twelve acre field and sampled the soil in about eight different places, fully representative as I thought, of the soil of that field. We dug a hole furrow deep at each place, and cut off a perpendicular slice from the side of each hole, about a quart. When we had secured our eight samples we mixed them all up together thoroughly, on a big flat stone and filled the baking powder can with a sample of the samples. This we took to the house and dried in the cook stove oven on an old pie plate. The whole job took about an hour.

Inoculate for Insurance

At the meeting in the evening the County Agent ran the test with others and showed only a slight indication of the need of lime. For safety he recommended an application of 1500 pounds, per acre. The field having been limed a few years ago and having shown a

good sprinkling of alfalfa plants from three pounds in the last regular seeding, I shall lime it only in part, in order to let the alfalfa itself check further its need of lime. And in spite of the good amount of alfalfa plants previously grown in the field we shall inoculate our seed for this insurance costs only 12½ cents an acre. Whereas lime insurance would cost about six dollars an acre and the test shows a doubtful need.

I think I detect a growing tendency hereabouts to delay seedings in the spring until after freezing, when the ground is firm. The old method was to select a frosty morning when the ground was honeycombed on the surface. We sowed our clover and timothy this way this spring. Several farmers have remarked to me of late that they believed they had as good or better success with later seedings. A few men drag the seed in but most do not. We shall sow the part of our alfalfa field after wheat, by this method dragging in the seed when the ground gets firm enough to hold a team.

Now its bed time. Tomorrow morning for breakfast we are to have pancakes with maple syrup made from sap gathered by my oldest small boy from trees in the yard, tapped by himself. Grandmother has had the kitchen stove covered with kettles of sap boiling down for several days.—M. C. BURRITT.

Farm News From Central New York

H. H. LYON

NOT in some years have we had so mild a March and one might say as much for February. Sugaring seems to be over before April begins and in some cases buckets were gathered nearly a week ahead of that date. Not so many trees have been tapped this year and markets for syrup do not seem to have been quite so active. Sales have been pretty fair and the local price has averaged about two dollars a gallon. A few got more for a part and some have sold for a little less.

In my locality I do not know of any planting being done but further north though possibly on lower ground peas at least have been planted to quite an extent. These are for the New York market. I remember a sason not many years ago when we sowed oats in March and got a good crop. This is very unusual. Meadows have come through thus far in very good shape. Hay is abundant and considerable quantities will be carried over. I know of no sale for hay at any worth while price. Good to have on hand though.

Feed dealers have had very light sales all winter. Feeds went too high. Now they have declined. One can get gluten feed at forty dollars with a prospect of its going lower. Corn still stays up close to fifty-five dollars, but hominy can be had as low as forty-seven. These may not be regarded as low feeds but milk of average test is likely to bring about as much as hominy costs by the hundred and more than gluten and wheat bran.

On the 28th we had two or three inches of snow that made everything very beautiful to say the least. Such snows are called the poor man's manure. At any rate it may be set down as having done farmers thousands of dollars of good. There has been but little moisture since the snow went off some time ago and this moisture will go into the ground in fine shape. Thus far the season is not bad. Cows however are frequently found that show the results of diminished feeding with sufficient digestible feeds and probably with too little protein to put them in condition. That is not true in all cases however; some have been well fed. We shall try to watch the effects of this low grain feeding on the year's production.

Zinc Insulated

Anthony Fence

BANNER

—FORMERLY
ARROW

R. R.
RAIL
SECTION
STEEL
POSTS

Zinc Insulated Anthony Fence is of the same sturdy, superior nature as the Banner (formerly Arrow) Steel Post, with its railroad rail design and large slit wing patented anchor plates.

Every wire of the fence is insulated against rust by a heavy coating of zinc, uniformly applied. The RED SIGN on every roll guarantees its quality.

Banner Steel Posts root firmly in the ground, hold the fence securely and tautly in line and give many years of service.

Sold at NO EXTRA CHARGE, Zinc Insulated Anthony Fence and Banner Steel Posts make the most economical fence you could own, giving many more years of service at lower cost per year. Ask your dealer.

Post Your Farm

Keep Trespassers Off

WE have had a new supply of trespass signs made up. This time they are of extra heavy linen on which the lettering is printed directly. There is no card facing to be water-soaked by the rain and blown away by the wind. We have had these new signs made up of extra heavy material because severe storms will tear and otherwise make useless a lighter constructed material. We unreservedly advise farmers to post their land and the notices we have prepared comply in all respects with the law. The price to subscribers is 95 cents a dozen, the same rate applying to larger quantities.

How the New Rural School Laws Will Work

(Continued from page 389)

AGRICULTURIST on February 2nd, and listened and took part in the discussions. At the end of the conference, Senator Cole went out, and from that time until the bills which he introduced passed, he worked almost night and day in their support and as a result, the farm people of the State owe much to Mr. Cole's intense interest and indefatigable work for better rural schools and lower rural school taxes.

Great credit also should be given to the leaders of the Home Bureaus, the Farm Bureaus and the State Grange for the support of the general principles involved in this legislation.

As passed by both houses, they were Senate bills print numbers 864, 865, 1237 and 1694.

The \$9,000,000 School Bill

Since bill 1694 is the one that appropriates most of the additional State aid, let us consider this one first. This is the one that came to be known as the \$9,000,000 school bill. As passed, this bill will take effect July 1, 1926, and, therefore, the first aid will be available during the school year 1926-27. It would have been better had this State aid been passed to take effect immediately so that farmers would have had sooner the benefit of the reduction of the taxes. But the delayed date when the bill will take effect was the best we could get.

This bill provides additional State aid to all schools, both city and rural, the increase in aid ranging from \$50 per teacher in New York City up to several hundred per teacher in some of the weaker rural districts. IT HELPS TO REDUCE TAXATION BY PROVIDING MORE MONEY FROM THE STATE AS A WHOLE TO RUN THE SCHOOLS. The highest taxes paid by the farmers are local taxes, such as school taxes. Since not much more than 10 per cent of the wealth of the State is in all the school districts which have a population of less than 4500, the greater the State aid the lower will be the local taxes.

Study These Examples on Tax Reduction

Let us see how Senate bill 1694 will effect the one-teacher districts. In the first place, the bill increases what is known as the additional quota for one-teacher districts from \$200 to \$250. Besides, it increases the special aid to districts having a valuation of less than \$60,000 as follows:

In districts having an assessed valuation of \$20,000 or less it increases from \$3 per thousand to \$6 per thousand the amount of State aid for each entire thousand dollars that the assessed valuation is less than \$100,000.

In the same way it increases the state aid from \$3 to \$5 per thousand for districts having an assessed valuation of \$40,000 or less, but exceeding \$20,000.

For districts having a valuation of \$60,000 or less, but exceeding \$40,000, the increase is from \$3 to \$4 per thousand.

How It Will Work In a Poor District

Let us take a typical district with an assessed valuation of \$18,000.

State aid under present law	State aid under bill 1694
District quota ..\$200	\$200
Additional quota 200	250
Additional for each entire thousand under 100,000 valuation \$3 now,	
\$6 under bill . 216	432
Total	616
\$882	

Suppose the school in this district costs \$1050. The amount to be raised by taxation at present is \$1050; \$616 paid by the State and \$434 paid by lo-

cal taxation. Therefore, the present rate of tax is a little over \$24 per thousand.

Under the new bill the amount to be raised by tax would be \$1050 less \$882 or \$168. Therefore, in the same district with the same school costs the rate of tax would be \$9.33 per thousand, a NET SAVING OF \$14.67 ON EACH THOUSAND OF ASSESSED VALUATION.

How It Will Work in Richer Districts

Take a district with an assessed valuation of \$35,000.

State aid now	State aid under bill 1694
District quota ..\$175	\$175
Additional quota 200	250
Additional for each entire thousand under \$100,000 valuation \$3 now,	
\$5 under bill 195	325

Total\$570 \$750
If school costs \$1050
Amount to be raised now \$480
Rate of tax now \$13.71 per thousand
Amount to be raised under bill \$300
Rate of tax under bill \$8.57 per thousand and
NET SAVING \$5.14 per thousand.

Here is an example of a typical district with an assessed valuation of \$53,000.

State aid now	State aid under bill 1694
District quota ..\$150	\$150
Additional quota 200	250
Additional for each entire thousand under \$100,000 valuation \$3 now \$4	
under bill 141	188

Total 491 588
If school costs \$1050
Amount to be raised now \$559
Rate of tax now \$10.54.
Amount to be raised under bill \$462
Rate of tax under bill \$8.71
Net saving \$1.83 per thousand.

Now take for a last example a typical district with an assessed valuation of \$90,000.

State aid now	State aid under bill 1694
District quota ..\$125	\$125
Additional quota 200	250
Additional for each entire thousand under \$100,000 valuation \$3 now \$3	
under bill ... 30	30

Total\$355 \$405
If school costs \$1050
Amount to be raised now \$695
Rate of tax now \$7.72.
Amount to be raised under bill \$645
Rate of tax under bill \$7.16
Net saving \$.56 per thousand.

Each other school district employing more than one teacher will receive \$150 per teacher more than it now receives. Therefore, a district employing two teachers will receive \$300 additional state aid under this bill. A district employing three teachers will receive \$450 additional state aid, etc. It is evident that this will materially reduce taxation in such districts.

Union free school districts maintaining academic departments will receive also in quotas \$150 per teacher in additional state aid.

Help For the Rural High Schools

Another provision of this bill which will materially aid in reducing taxation in high taxed high school districts is section 491-b. Under this section ap-

(Continued on opposite page)

Be sure to say that you saw it

in AMERICAN AGRICULTURIST

How the New Rural School Laws Will Work

(Continued from opposite page)

portionments are made to all city, village and union free school districts maintaining academic departments on an equalization plan. Such apportionments are also made to all districts which employ five or more elementary teachers.

Probably the highest taxed districts as a group are the so-called rural high school districts. Many farmers live in such districts, and many of them are paying from \$20 to \$30 or more per thousand in school taxes. The schools maintained in these rural high school districts are the schools in which rural boys and girls get their high school education. Under this provision of the bill aid will be distributed in such a way that the weaker or low valuation districts will get material help. This applies the same principle in apportioning aid, but in a different way, that is illustrated above in the one-teacher districts of less than \$100,000 valuation. It is expected that under the provisions of this bill few of either the common or union free school districts will be required to pay a tax rate of more than \$10 per thousand.

The Enlarged District Bill and the Central Rural School Bill Nos. 864 and 1237

It is well to consider next in order the bill providing for financial aid to enlarged districts and the one providing additional aid to central rural school districts. These bills provide amendments to the present Education Law and are not new provisions of the law except that additional State aid is provided. It is well to remember this fact.

First, bill 864 is an amendment to section 134 of the Education Law, which section provides financial aid to enlarged districts. As the law now stands, when two or more districts have united to form a larger district such new district will receive all the state aid that the separate districts received before they were united. This amendment provides that in addition to all the aid that they would receive under the old law and under the proposed plan of apportionment, such enlarged district would receive one-half the cost of transportation, if any transportation for pupils is provided. This bill is retroactive and provides this aid for all districts that have been established since March 25, 1913. There are many such districts in the State, and it is evident that this new provision will help materially in reducing taxation in such districts where transportation is provided, and also will be of great aid to such districts which may hereafter be established.

Aid To Transportation Costs

Bill 1237—This also is an amendment to the present law. Section 183, which this bill amends, has been on the statute books in its present form since 1914. By the amendment provided in this bill such central rural school districts when established will receive in addition to all other aid which they would receive either under the provisions of the present law or by the provisions of bill 1694, a transportation quota of one-half the cost of transportation, as explained above, and in addition thereto, a building quota which will be equivalent to one-fourth of the sum actually expended on and after the taking effect of this act. These quotas will be available if the tax rate in the district is five mills or more. This bill is not retroactive in its provisions. As now provided in law, such central rural schools can be established only by vote of the people and there has been no change in this respect by this amendment. It simply gives the additional aid of transportation quota and building quota after they have been established. These quotas are in addition to all other aid which the districts would receive before they united to form a central rural school district, and also

in addition to all aid that they might receive under the equalization plan explained above.

The bill also more clearly defines the duties of boards of education in such districts and gives them practically the same powers and duties that boards of education now have in union free school districts. Neither this bill nor bill 864 (the enlarged district bill, compels people to consolidate. It gives them more aid and consequently helps to reduce taxes when they do consolidate. It should not be forgotten that both bills are amendments to present law.

The Training Class Bill

Bill 865 amends section 502 of the Education Law, which is the section that provides money for the support of training classes. It is a well known fact that as a whole, the most successful teachers in the one-room schools are those who have come from the training classes. Heretofore such classes have been maintained only in those union free school districts which were willing and able to pay a portion of the expense. This bill increases the quota for training classes from approximately \$1650 to \$2000 for each training class teacher. It also provides that of the \$2000 at least \$1800 must be paid toward the teacher's salary. This will leave \$200 to be used toward maintenance. The number of training classes to be established under this bill is limited to 100. There are now approximately 70 such classes in the State. It should relieve union free school districts where such classes are maintained from paying any portion of the expense and should be an encouragement to establish more classes. If efficient rural schools are to be maintained there must be good teachers. Rural people should be gratified at this recognition of the need of better trained teachers for rural schools. This bill has been signed by the Governor and is now a law.

R. W. Dunlap, of Ohio, Appointed Assistant Secretary of Agriculture

R. W. DUNLAP of Pickaway County, Ohio, has been appointed Assistant Secretary of Agriculture by President Coolidge. He comes directly from his work of managing his farm and those of his father to his work at the Department of Agriculture.

The new Assistant Secretary was born on a farm in Pickaway County in 1872. He received his early education in a district school, and later attended high school while he lived on the farm and spent his spare time in helping carry on the farm work. He entered the College of Agriculture of Ohio State University in 1890 and was graduated in 1895. Since then he has spent most of his time on his farm near Kingston, Ohio. Until 1923 he operated it as a grain, cattle and hog farm, and since then has added a dairy. He was one of the early members of the Grange and of the Farm Bureau in the United States.

Long experience in the livestock business has given Mr. Dunlap an opportunity to visit many of the livestock markets in the country. He has either bought or sold stock on the markets at Chicago, Buffalo, Pittsburgh, Kansas City, East St. Louis, New Orleans, Jacksonville, Fla., Fort Worth, Cincinnati and Columbus. He has owned herds of purebred Shorthorn cattle and Duroc hogs and has exhibited animals of his breeding at county fairs and at the Ohio State Fair. He has acted as judge of horses, cattle and hogs at many fairs and expositions.

For several years he was State Dairy and Food Commissioner, and while holding this office did much to eradicate impure and misbranded foods, drinks and drugs from the market. After retiring from this office he again went to farming and continued until 1915, when he was chosen by the State Board of Agriculture of Ohio as its Secretary.

Five Different Varieties

Glorious Colors

4 BEST RED—W. C. GAUNT (Alex. Dickson)—Of medium size, with pointed buds, with naturally reflexed guard petals of brilliant velvety vermilion, tipped scarlet. Stems rigid, habit branching, large oval beechgreen foliage. Rich tea fragrance; very rich in color.

4 BEST PINK—MARJORIE BULKLEY (H. T.)—Of strong, free branching growth; buds long and rounded, opening into buff, heavily flushed with rose, and finishing into silvery-pink; of ideal habit, opening freely in all kinds of weather. Grand garden Rose. Awarded Gold Medal.

1 PINK CLIMBING—ROSARIE, or PINK THOUSAND BEAUTIES—This is a bright pink form of that famous Rose, "Thousand Beauties." A grand Rose from any standpoint. We want all of our floral friends to have this Rose. Wonderful in every respect and sure to please.

4 BEST WHITE—EDEL (H. T.)—Type, of the variety Forrester; bud very large; flower very large, double, well built, stately; of pure white, with faintest ivory shading toward the base, passing to pure white. Foliage bold and distinct. Very vigorous grower; free bloomer.

2 BEST YELLOW—LADY PLYMOUTH (Alex. Dickson)—A most distinct and meritorious Rose of the "Souvenir de Pierre Notting" type whose delicate pearly but deep ivory-cream petals are very faintly flushed, giving it a most piquant finish that is difficult to describe. It is delicately pure tea perfumed. Awarded gold medal, N. R. S., and silver medal, Crystal Palace, London.

Should we find it necessary to change any variety, we guarantee that a Rose of the same color and equal value will be sent.

BABY

CHICKS

LAWRENCE P. UHL

THE OLDEST AND LARGEST INDIVIDUALLY OWNED AND OPERATED HATCHERY IN OHIO. I am a PIONEER in the Baby Chick business. For 20 odd years I have been producing high class Baby Chicks which have gone out to thousands of Poultry people of America and proven highly satisfactory. For years previous to 1919, (when he retired), I was associated

with M. Uhl, New Washington, Ohio, who was Father and originator of the Baby Chick business in Ohio, making the first shipment of Baby Chicks 25 or more years ago. Since 1919 my output has been entirely taken by dealers who supplied a long line of year after year customers. I have now decided to give the GENERAL PUBLIC an opportunity to buy my high class Chicks direct from the Hatchery here at New Washington and I am in a position to furnish these excellent Chicks in almost any quantity and on short notice at the following prices:

	50	100	500	1000
100% Live Delivery Postpaid. Prices on				
White, Brown and Buff Leghorns	\$7.00	\$13.00	\$62.00	\$120.00
Sheppard Anconas, R. C. Brown Leghorns	7.50	14.00	68.00	130.00
Barred and White Rocks, Black Minorcas	8.00	15.00	72.00	140.00
S. C. and R. C. R. I. Reds	8.00	15.00	72.00	140.00
White Wyandottes, Buff Orpingtons	9.00	17.00	82.00	155.00
White Minorcas	10.50	20.00	95.00	
Silver Laced Wyandottes	10.00	18.00	85.00	
Light Brahmas	13.00	25.00	120.00	
Assorted, Heavy Breeds	7.00	13.00	62.00	120.00
Assorted, Light Breeds	5.25	10.00	48.00	95.00

For quick action, you can order direct from this advertisement in perfect safety. Reference; Farmers State Bank, Dun's or Bradstreet. Or get our free Catalog and further details as to prices on extra select Chicks. Write your exact wants at once if you cannot make up your order from above price list. I want your business this season and you may rest assured that we will take care of you RIGHT. Only 18 hours from New York. I am now the ONLY one of the Uhl family owning and operating a Hatchery. BE SURE to address as below.

In the Absence of Biddy

(Continued from page 397)

cod liver oil. With this assurance of sunny days, whether it is raining or snowing outside, the task of a poultryman is made easier.

Do not forget, however, that the air in a colony house becomes dead. Make a provision of some sort so that fresh air can circulate, carrying off all the impurities. By hinging windows at the bottom and blinding them on the sides with boards, the air enters and circulates above the chicks and without interfering with the stove.

Get the Chicks on Ground Early

There is just one other point; get the chicks out on the ground as soon as they have learned to run in and out under the hover. An outside door should be fairly large and easy for the chicks to find. When this door is on the level with the ground, they find it more easily than when they have to run up and down an incline. As an extra preventive of trouble I saw an excellent idea the other day. This was a sloping roof, perhaps five by ten feet. This roof without any sides was attached to the brooder house a couple of feet above the chick doorway and had a slope of a foot. It was without sides, but you can see the value of it. In case of rain the chicks could run under the cover and take their time about entering the brooder house. Or, in disagreeable weather,—the day I saw them there was four inches of snow on the ground—they have a chance to get on the ground and to harden themselves against the cold without actually getting out where it was wet.

As the writer said earlier it is impossible to lay down rules for brooding chicks. Steady, conscientious care can raise almost any brood, but the way has many pitfalls. The best way to avoid them is to know about them first.

Treatment To Cure Roup

Our chickens are dying with a disease which causes their mouth and throat to be very sore. The windpipe also becomes all festered. Could you advise what to do for this?—T. E. Upole, Cecil County, Maryland.

It is very difficult to diagnose diseases of poultry at long distance, particularly when the symptoms may indicate one or more of several troubles. From the description it would seem that the fowls are suffering from contagious catarrh or roup. This accompanied by an offensive odor from the bird's mouth. The eyes often are attacked and become inflamed and swollen and a tumor of the eye sometimes develops.

The disease may run for several weeks or often longer but in some cases ends fatally within a very short time. The trouble is very contagious and is transmitted in the drinking water or through the soil to other fowls of the flock. With roup, as in many other poultry diseases, the first procedure is to separate the infected fowls from the rest of the flock, placing them in disinfected coops and treating them separately until well.

Treat the Flock to Prevent Spread

When cases of roup are noticed, the entire flock should receive a disinfectant in the drinking water, such as potassium permanganate, which is added in sufficient quantity to turn the drinking water a light cherry red. The drinking water should be changed daily. The poultry houses and runs should be disinfected with any of the standard disinfectants, such as a 2% to 5% creolin solution.

For individual fowls affected with roup, the mouth and nostrils may be washed out with a solution of 5% carbolic acid, a 50% hydrogen peroxide, or 2% per-

Raise Chicks to Make Money

1925 promises to be a great year for chickens—layers are scarce, work is plentiful, folks have money to spend and living is going higher. There is always ready sale for fresh eggs and home-dressed fowl, higher than market prices. Cooley's chicks will be laying five months after their arrival. My strains of Leghorns are truly remarkable layers.

Cooley Chicks are the Healthiest, Most Vigorous, Desirable Chicks Hatched. They Always Satisfy.

50,000 customers know these facts.

Write today for
COOLEY'S NEW CHICK BOOK
and chick prices.

It's the most interesting book of the year for those who have room for as few as a dozen laying hens and also contains much helpful information for the oldest and largest poultry keeper.

managanate potash solution. The later only is preferred by many poultrymen.

It is important to clean out the passage of the nostrils which may be done by pressing the roof of the bird's mouth from outside and squeezing the nostril from above downwards. A syringe may be used to spray the nostrils. The fowl's head may be dipped for a few seconds in a solution of any one of the disinfectants, although prominent poultrymen often recommend the dipping of the fowl's head only in permanganate of potash. After treating, the fowls should be kept separate from the others until entirely well.

Roup is such a contagious disease that when it once gets a foothold in the flock it is best to dispose of infected birds, change the position of the houses and equipment, disinfect new runs and keep continual watch against further outbreak of the trouble. *Be sure to isolate all infected birds.*

Hens Eat Feathers: How to Stop Them

Could you tell me why my hens eat one another's feathers. They have just begun. What is good for them. Some have their necks bare. —Mrs. H. M. New York.

FEATHER eating is rather a vicious habit or vice among fowls. It is usually acquired during the spring or molting time. Various causes have been ascribed to this habit. Most commonly it is a fault in the ration. However, lack of exercise will also induce the practice. Then again, irritations of the skin induced by parasites such as lice or mites, may be responsible for the habit.

In making an attempt to cure this condition, it is first advisable to see that there are no parasites present. Clean your hen house thoroughly to the extent of spraying or painting it with a good disinfectant, making sure that the disinfectant reaches every crack or crevice. Mites are in size, as their name indicates, very minute. It is hard to see them with the naked eye, unless there are great masses. Any number of them can hide in a small crack in a board. Therefore see that the disinfectant reaches all hidden places.

Give Them More To Do

When the actual management of the birds is concerned, the first thing to pay attention to is the amount of exercise they are getting. The birds should have a free run and they should be made to scratch for a large portion of their food. This exercise will improve their digestion and furthermore gives them something to occupy their time. Birds that have no difficulty in finding their food, satisfy their appetite and then repare to the idle practice of hunting lice and eventually develop the feather eating habit.

In some cases the habit is due to insufficient animal matter in the ration, or feeding too long on one kind of grain, particularly corn. It is therefore essential to have a well balanced ration, which should include milk of some form, either skim milk, semi-solid buttermilk or powdered milk. A little beef scrab, ground bone, green food, along with a regular balanced mash and scratch mixture. The item of oyster shell or grit must not be overlooked. Some authorities recommend the daily administration to the hens of 6 or 8 grains of a mixture of equal parts of powdered gentian roots and ginger.

It is advisable to isolate the hens that

have the habit, so they may be treated individually. It is also advisable to remove the hens that have suffered the most by having feathers pulled, putting them by themselves, in order that they may recover. Furthermore they take away temptation from the rest of the flock.

Feeding Those Baby Chicks

I am buying baby chicks this year instead of incubating my own. After they arrive do they need different care from those I raise at home? Please tell me some grain and mash formulae that have been carefully worked out and found to be good.—Howard J. Lynn, Chautauqua County, N. Y.

THE first thing to do upon receiving a shipment of baby chicks is to open immediately the box and get the little fellows into dry, warm sanitary quarters. They should be carefully examined for evidence of disease or bodily injury in transit. They are usually thirsty and often hungry if they have come any distance. The same as with securing any live stock from outside of the farm it is well to "quarantine" the baby chicks for a period of ten days or two weeks after their arrival. This allows any disease to appear and prevents contamination of the rest of the poultry.

When chicks are purchased from reliable hatcheries there is, of course, little danger from disease but, nevertheless, the method is a wise precaution. From now on the chicks are cared for in the same way as you would care for those raised on your own place. The first few feedings should be very light as overfeeding of very young chicks is frequently fatal. Experienced poultrymen never feed their chicks until 48 hours after the hatch is complete, whether the chicks are raised at home or purchased from one of the commercial hatcheries.

The Cornell Rations

The poultrymen at Cornell have worked out a series of grain and mash formulas for feeding baby chicks which are bringing excellent results throughout the state. The difference in the formulae take into account the rapid growth of the chick and for purpose of quality they are described as Grain Mixture No. 1, Mash Mixture No. 1, etc.

These mixtures are composed as follows:

GRAIN MIXTURE NO. 1

5 pounds cracked corn (fine)
3 pounds cracked wheat
2 pounds pinhead oats, steel-cut oats or oat flakes

MASH MIXTURE NO. 1

2 pounds wheat bran
1 pound wheat middlings (flour middlings preferred)
1 pound cornmeal or hominy
1 pound sifted ground oats
1 pound sifted meat scrap (best grade)

GRAIN MIXTURE NO. 2

6 pounds cracked corn (medium)
4 pounds wheat

MASH MIXTURE NO. 2

2 pounds wheat bran
1 pound wheat middlings (flour middlings preferred)
1 pound cornmeal or hominy
1 pound ground oats
1 pound meat scrap

GRAIN MIXTURE NO. 3

500 pounds cracked corn
200 pounds barley
200 pounds wheat
100 pounds heavy oats

MASH MIXTURE NO. 3

100 pounds wheat bran
100 pounds wheat middlings
100 pounds cornmeal
100 pounds ground oats
100 pounds meat scrap
3 pounds salt

Method of Feeding Rations

Grain and Mash Mixtures No. 1 starts the third day after the hatch and are used to the sixth week. The grain is fed in the litter three times a day, morning, noon and night. The mash is moistened with sour milk or buttermilk and fed twice a day between grain feedings. Chopped

BABY

CHICKS

green food should be combined with the mash.

Beginning the second week, Grain Mixture No. 1 is fed in the litter twice a day, morning and night. Mash Mixture No. 1 is gradually changed to Mash Mixture No. 2 when the birds are large enough to handle it. This varies somewhat but will usually be when they are from four to six weeks old. Mash Mixture No. 1 is moistened with sour skim milk or buttermilk and fed once a day, at noon. Mash Mixture No. 1 (dry) should be available from four to six hours a day.

From the sixth to the twelfth week, Grain Mixture No. 2 is used, the feeding being given in the litter three times a day, morning, noon and night. Mash Mixture No. 2 (dry) is always available in hoppers, troughs or boxes during this period.

From then on to maturity Grain Mixture No. 3 is fed in the litter twice a day, morning and night. Mash Mixtures No. 3 (dry) is always available in the hoppers, troughs or feeding boxes. One meal of moist mash may be fed if rapid development is desired. About three parts of grain are fed to every two parts of mash.

Milk in Chick's Diet

During the first week skim milk or buttermilk is considered indispensable. To get the chicks acquainted with the milk it is advisable to dip the chick's beak in the milk before he gets any other food. This can best be done when removing chicks from the incubator. If the chicks have all the milk they will drink the meat scrap may be eliminated from the ration and 10 per cent of bone meal added in the mash to replace it.

When the dry or semi-solid milk products are used they should be diluted to such an extent to approximate the fresh milk which contains about 3½ per cent protein. If the semi-solid butter contains about 18 to 20 per cent protein, one pound of the buttermilk should be added to five pounds of water.

Fine grained oyster shells are, of course, made available from the stock and clean, fresh water is always available.

In changing from one formula to another, poultrymen have found that a

gradual change does not disturb the digestive organs so care should be exercised in this regard. If the chicks do not exercise and if they fill up on the dry mash and do not appear to be hungry for the grain feeding, then the mash should be removed for part of the time and the amount of the grain somewhat reduced.

How Long Weed Seeds Live (Continued from page 390)

that the seed he buys and sows is as nearly free from weed seed as is possible to obtain it.

Many individuals and firms dealing in seeds are already doing all that they can to supply the farmer with clean seed. It is to be hoped that, through improved methods, conscientious seed growers and seed dealers may supply the user with seeds of even higher quality.

In many states laws are already in force which prohibit the sale of seeds, unless they measure up to certain standards of purity, or else require that the impurities of the seed must be indicated upon a label attached to the seed container. The New York State seed law requires that seeds offered for sale must be provided with a label containing, among the other information, a statement of the percentage of weed seeds, and the names of noxious weeds contained in them.

Necessary to Prevent Weeds from Developing Seeds

These facts point out not only the extreme importance of sowing clean seed but also emphasize the necessity of preventing weeds from seeding. If it is important not to sow seeds containing weed seeds, then it is many times more important not to let the progeny of weed seeds sow seeds. After these seeds once get into the soil some of them may remain there and retain their vitality for many years.

It is true that each plowing will bring some seeds to the surface so that they may germinate but of most weeds not all seeds will perish during the systems of crop rotation usually practiced in New York State. Unfortunately much farm land is already infested with seeds of many kinds of weeds. In such infested land it is of relatively little value to try to prevent weeds from growing by sowing clean seed unless other precautions are also taken.

In attempting to keep land free from weeds which reproduce largely by seeds (most annuals, winter annuals, and biennials) it is therefore important to observe several precautions. Do not sow seeds containing weed seeds. In case weeds get started, kill them before they can produce seeds. If weeds have already gotten a start and the soil is already infested with seeds produced by them, efforts should be taken to induce the seeds to germinate, specially at a time when their offspring can be killed soon after germination or at least before they have had a chance to produce more seeds.

Where to Write For Information

Farmers of New York State may have seeds analyzed for impurities, or weeds identified free of charge. Those wishing to have seeds tested should write to the Seed Laboratory, New York Agricultural Experiment Station, Geneva, New York, and obtain a copy of the rules for taking and sending samples of seeds to be tested. Anyone wishing to send weeds for identification and advice as to eradication or control methods should send enough of the plant to show leaves and if possible flowers or fruits to the Department of Botany, New York State College of Agriculture, Ithaca, New York.

The Trouble Maker—By E. R. Eastman

VILLAGERS vied with farmers in wild efforts to express their joy. Men capered, slapped one another, and shouted like foolish ten-year-olds. Women clung to each other and laughed with a laughter that was almost hysterical. Suddenly all over the town the church bells began to ring. Then the din was increased by the deep-toned whistles of the mills.

The crowd finally paused for want of breath only to break loose again as they saw Taylor and his lawyer coming down the courthouse steps. Yelling, swinging their arms and hoorahing, the crowd surged toward the two men. Those who reached Winslow and Taylor first, grabbed them and hoisted them on their shoulders; then still shouting and yelling, they started down the street.

Hark! what was that? Drums!

As if by magic, a small part of the village band, hastily assembled, appeared at the head of the procession. There was a muttered order and the band began to play. With the first note, the tumult died down, only to rise again in a great shout as the crowd realized what the band was playing.

"When Johnny comes marching home again, hurrah, hurrah!***"

Over and above the rollicking old victory song could be heard the deep, commanding rumble of the drums.

"Come! Come! Come along with me!
Come! Come! Come along with me!"

With Taylor and Winslow riding on their shoulders, down the street the crowd went, while the band played, the bells rang, and the whistles blew.

As they marched and played and sang, Dorothy Ball, waiting in a friend's home, heard them; and as she listened, the tears streamed down her face. Who shall say if they were tears of sorrow or of pride and joy?

And a tall lawyer, surging along on men's shoulders, carefully carrying a tall silk hat, heard them and smiled a crinkly smile at the younger man, riding next to him on the other shoulders.

And a little sheriff standing on the courthouse steps saw them and heard them, and as he listened, he too smiled, but there was no coldness or hardness in his eyes when he said:

"Nice people; nice, peaceable, quiet people!"

CHAPTER XXVIII

IN the days following Jim's trial and the end of the milk war, the dairy country settled into the ways of peace again. Men and women went about their work, milked their cows, and delivered the milk to the stations much as if nothing had happened. But in their hearts they knew that things were different.

Hope was born again, and faith, faith in their business, faith in the future of their homes and above all, faith and belief in one another. For the first time perhaps in history farmers had proven once and for all that were the necessity keen enough, they could stick together.

In Speedtown, discussions for a few days ran high about Judge Rising's suicide. But Winslow, Taylor and Messenger, the three men who knew why that unworthy career came suddenly to a violent end, had nothing to say, and the gossip soon wore itself out, for want of material to feed on.

The same was true of the milk strike. So pressing are the small details of everyday life that even the big events of our lives are relegated to closed chapters and seldom opened.

Except for Carolina Hicks and a few of her cronies, the strike events soon were referred to only occasionally. League men dumped their milk into the same vat at the station with a few non-Leaguers, and there was no argument and little bitterness. For the most part men were tired of contention

and seemed willing to let by-gones be by-gones. Most men are like that. They may quarrel and fight, and if the fight is above board and on the square, when it is over they will shake hands and call it a day.

But between Jim Taylor and John Ball, there had been no reconciliation. They met and spoke, to be sure, but on the souls of both pride rode like a tyrant, and the peace between them that both would have welcomed did not come.

Coming home from delivering his milk one morning, a few days after the trial, Jim turned out to let a car pass him. When it was nearly by, Bradley, the driver, recognized Jim and leaned out to wave a friendly hand. As Jim waved back he caught a glimpse of a girl in the seat with the county agent. It was Dorothy. Save for this once, Jim had not seen her since she had been on the witness stand at his trial.

The sight of her with the county agent started a strain of bitter reflection in the

coming up to see me tonight after supper to have a long talk. Men friends are all right; have to keep to them; women can go to thunder."

Having thus cheerfully settled the whole feminine question at one swoop, Jim squared his shoulders and urged his horses into a trot to get back to his work.

But he had not yet learned what all men sooner or later come to know; that is, that they can tell the women in their lives to "go to thunder," but that the women probably will not go, and if they do, they will not stay—and most men eventually come to be everlastingly thankful that they will not.

That night after supper, Winslow and Messenger sat with Jim on his porch.

"Told you this mornin'," said Dave, "that I might drift out this way tonight for a visit. When I mentioned that I was comin' to Winslow here, he 'lowed that it was so darn hot today that he would like to ride along and cool off. Told him I was a little particular whom I rode with, but

What Happened in the Story Last Week

JIM Taylor's trial is over. The jury has returned a verdict of "Not Guilty," clearing Jim of the charge of being a "Trouble Maker," which was lodged against him. The case has ended in a most dramatic manner. As the jury was about to render the verdict, the presiding judge, who is a rogue in sheep's clothing, shot himself rather than face the consequences of having his dual personality revealed. After the verdict was rendered but before the court is adjourned, a telegram was received and read. It stated that the milk dealers have agreed to the farmers' der and deliveries are to be resumed on the morrow. The crowd is too stunned by the rapid succession of dramatic events to realize at first the full significance of things and they leave the court a silent mass. Once out of doors, however, the pent up feelings of the farmers find expression and "the lid is off."

boy's mind. There had been a few minutes at his mother's funeral when it had seemed to Jim that the misunderstanding between him and Dorothy had cleared, and that she at least sympathized with him in his troublesome problems. More than this, he had dared even to hope that she had reached across the gulf which had existed between them for the past months to extend to him again something more than friendship.

Then had followed the trial and her testimony, while he had held his breath for an agonized second waiting for her to express her unqualified faith in him. Instead, he thought sadly, she had denied him; had said when Hamilton put the question to her if Jim were present when the milk was dumped, that she did not know, was not sure. Did not really need her testimony as far as the trial was concerned, he thought, but he did not need her faith.

The boy shifted his position on the seat of the milk wagon, and absently flicked his whip at a bot-fly on one of the horses.

"What makes it so hot?" he said aloud. "Regular July day. Must be going to storm."

Then he returned to his thoughts again. Wonder if that's the way with all women—fair weather friends? Well, one thing was certain. He had come through both the strike and the trial without any help from Dorothy. Wonder what she really thought when things began to break his way in spite of her and her father? A smile chased the somber look out of his eyes as he thought of Caroline Hicks.

"Goin' to get me a black cat," he said. "Black cats, Friday and thirteens are just my combination."

The turning in the lane had certainly started for him on October 13th, he thought more cheerfully. Maybe the better things would keep coming. Not only for him, but for these farm people. Winning the strike was not the end; it was the beginning.

"Wonder what Dave had on his mind this morning," he thought. "Said he was

he said as how he was not, and climbed right in the ear!"

The men laughed, and sat quietly smoking for a time.

"What was that?" asked Messenger. "Thunder."

"Sounded like it," said Jim. "Wouldn't be surprised if we got a real storm. Been hot as the dickens all day. Unseasonable this time of year."

"All the weather in this country is unseasonable," grunted the sheriff. "Rains when it ought to shine, and shines when it ought to rain."

"Shouldn't think the weather would make much difference to you fellows who live in town," said Jim, "particularly if you know as much as the hens do and get under the shelter when it rains. But with us farmers, it's a different thing. Weather is our bread and butter. A long spell of rain or drought at the wrong time makes a difference between profit and loss in our whole year's business."

"That's right," said Dave. "Farmers are always cussing the weather. I remember I used to when I was farmin'. And they have enough reason to."

The conversation stopped again, and they heard once more the distant rumble of thunder.

"Storm's comin' all right," said Dave. "So I'll get right down to business. Jim, Winslow and I really had a little object in comin' out here tonight. Rising's suicide has sort of simplified the situation all around. It's brought an end to my own trail at last, and it has helped things in this county. But it hasn't entirely solved all the trouble."

"What do you mean?"

"Rising was the big boss," said Dave, "and he's gone; but so far as the local political situation is concerned, he left some powerful followers. They have got together to put in some candidates in the coming election that will run the county in the same old way, if they are elected. The biggest office and the one with the most influence is the one which was left open by the death of Rising. I have been talking

to Winslow here that we've got to clinch the work we started when we got rid of Rising and put some good man into office. Winslow has agreed to this, but he won't agree to my candidate for the county judge."

"Who is he?" asked Jim.

"Winslow," said the sheriff.

"I have never been an office-seeker," said Winslow quickly, "and I don't want to be classified as one now."

"You wouldn't be," said Jim, "not by anybody who knows you. I agree with Dave. If a young man can tell an older one his duty, I believe you have a responsibility to take this office and use it and your influence to set this county straight, and keep it going straight."

has the influence with the farm people that you do. If you pass the word as to what we are trying to do and that Winslow ought to be elected as county judge, he will be, and that's all there is to it."

"Dave is right," spoke up Winslow for the first time in several minutes. "You have a real opportunity for doing some worth while thing because of what the people think of you. But I'm not saying by any means that one of those things is putting me into office."

"That's already settled, Winslow, and you might just as well keep still," said Dave. "With Jim's help and with the class of people in the towns that will back this movement, we will put the local government in this part of the state where we can point to it with pride and where others can turn to us for an example. When that's done," he added with a half humorous, half wistful note, "maybe old Dave Messenger can get a little rest and peace."

"I am not sure that I can do much," said Jim, "but whatever I can do, you can be sure I will."

"Understand," said Winslow, "that we are not asking you to get mixed up in a partisan situation. This is not a question of party. It is a problem of the good elements in both parties working together to clean up a condition which has been a disgrace to this county for a quarter of a century."

"Speaking of accomplishing things worth while," said Taylor, "I was thinking today when I was coming home with the milk how much farmers were going to be able to do now that they have learned how to work together. Read the other day about what someone said about a New Day in agriculture and I thought maybe this strike had started a New Day in this business of milking cows."

Neither man made any reply and after a moment Jim said:

"Don't you think so?"

The lawyer tipped his chair down and pulled his long legs off the porch rail.

"Glad you mentioned that, Jim, for it brings up two or three things about winning this milk strike that I wanted to say to you."

He stopped, fumbled in his pocket for a match and a cigar, and after a moment its smoke and fragrance blended with the strong odor of the sheriff's old pipe.

"Dave and I were talking about this milk strike, too. Understand, both of us have been in favor of it, and are glad you won."

"What are you trying to get at?" asked Jim, sensing the reservation in the other man's voice.

"Well, I have been afraid," answered Winslow, "that you would expect too much. The League is all right, a good thing, but there's never been any millennium in the milk business or in any of the other affairs of us human critters, and Jim, boy, there ain't going to be any now."

"Oh, I know that," said Jim. "But I think the League is going to be able to get some better prices."

The sheriff bent forward in his chair to knock out the ashes from his pipe on the porch railing.

"The League will get better prices for

(Continued on opposite page)

a while, Jim, but it is because Winslow and I believe in what you are trying to do that we are tellin' you now that you do not want to make the mistake or let the farmers make the mistake of expecting the League to do too much. Take the matter of prices, for instance. If you get prices up where they belong for a while, more farmers will rush around and work long hours to produce more milk, and down will come the prices, in spite of what the League can do."

He stopped a minute while they listened to the rumble of thunder. Then he went on.

"Of late, when I could get a little quiet time by myself, I've been reading history, and the more I have read the more I've come to see how slow progress has been built up. Just a little at a time. An inch here, maybe a foot there, and then something has happened like this milk strike when we seemed to have made a big jump. Then we run along for twenty-five years and fall back again, and the only hope we have is that we won't fall back quite to where we started. Judging from history, it's not very hard to prophesy the future of the League.

"Winslow is right. It can bring no millennium. You've just won a very fine victory. The League will keep on growing for a while. Maybe most of the farmers will join, then milk will increase, prices will go down and there will come times of discouragement. Enthusiasm will die out, men will criticize the organization, members will desert—"

"And," interrupted Winslow, "farmers won't pay enough attention to electing good leaders and to the other troubles will be added bad management. So Dave and I agreed the other day that sometime we'd say these things to you so that maybe you will have them in mind, not to be disappointed, or let the other farmers be too discouraged, when the bad times come.

"But we don't want you to misunderstand what we are saying. This fight of yours has been a great jump forward. Hard times will come again, so that your organization may get down pretty close to the cushion, but all of your work and your faith have been justified just the same, for these farmers never will quite lose all that they gained by what they have been through this fall. In other words, twenty-five years from now, maybe even ten years from now, farmers will look back and will see where they were wrong in expecting too much from the League, and they will see also that even the shorter step toward better things made the great fight worth while."

While he had been talking, the dusk in which they had been able to dimly see one another had turned to an inky blackness. It seemed to make the oppressive heat almost smothering. The sheriff got up and moved around in the dark on the porch.

"I'll be glad to see the rain," he said. "It'll get rid of some of this confounded heat. Winslow and I have been doing a lot of preaching to you, Jim, but we may as well get it all out of our systems since we're started. While we're talking about the League, I can't help sayin' that I feel kind of sorry for poor old Johnny Ball. This milk strike business has put years on the old man."

"I'm sorry, too," said Jim.

"This sounds funny, I know," continued the sheriff, "but Jonhy Ball and those like him were partly right. He's an old man and done a lot of readin' and thinkin' and he knows that there can be no cure-all in the milk business. He says that he and his wife got their property together by hard work, and have no one to thank but themselves for it. I've heard him say that the trouble is the young folks think they ought to begin where their fathers left off. And instead of settling down and workin' to success step by step, modern young folks want to try out newfangled schemes like organization and such-like to do the impossible."

Suddenly the whole landscape was lighted up by a vivid flash of lightning followed in a second or so by a great crash of thunder.

ager to get it as soon
as possible.

THERE'S been a big difference in quality between various brands of pictures for some years past, and naturally those going to the movies regularly discovered it first.

The same great quality that has made this concern or that the leader in harvesting machinery or automobiles or oil has also made one concern the leader of the motion picture business.

You can see the difference, the real superiority in entertainment values in any Paramount Picture.

Don't stay home every evening! Dreams come true with these better pictures, dreams of seeing and sharing all the wholesome excitement that life could give you with youth, beauty and a barrel of cash!

Look back over your own life!

Have you had your share or more of monotony and chores? Begin now to balance work with entertainment and your heart and work will be lighter.

Broadway itself has nothing finer to offer than Monsieur Beaucaire, Wanderer of the Wasteland, Salomy Jane, Grumpy, Flaming Barriers and dozens of other wholesome Paramount Pictures.

Paramount Pictures attract regular visitors and more life to any community. The theatre improves and attracts people from miles away. Make it a real community center—a meeting place for young and old.

Young folks don't quit for the cities when life's worth while at home.

Meet your theatre manager. Every Paramount exhibitor wants to know his patrons, particularly people from out of town. Encourage him in his choice of the better pictures.

Paramount Pictures

Famous Players-Lasky Corporation, New York City

If it's a Paramount Picture it's the best show in town!

"Going to get your rain all right," commented Winslow.

Dave went on.

"As Winslow and I have been saying, your League friends will make mistakes in being over-enthusiastic, and where Johnny and his followers will make theirs is in allowing no credit at all to new ways and new schemes like the League."

"According to you, then," said Jim, "we're both wrong."

"That's just the point," answered Winslow. "Dave has it right. Like most fights, both sides are partly right. The truth always lies somewhere between the fighters, somewhere near the middle of the

road."

Again the inky blackness was relieved by the glare of lightning that made surrounding objects stand out in grotesque and unnatural relief. A great peal of thunder shook the house.

"As I was saying," said Dave, "I'm sorry for old Johnny. I was talkin' with him the other day since the strike ended, and I believe he cares a lot for you. I know it kind of worries him because he did you wrong about the dumpin' of the milk. I suggested that if he felt that way why not go to you and tell you that he

was sorry. He said that he had thought of it, but probably you'd order him off the place. Said he wouldn't blame you if you did."

"I'm awfully glad to hear that," said the boy. "Johnny's been like a father to me and I've felt pretty badly all summer because this milk business came between us. If he feels that way, I do, and maybe we can straighten things out."

"Good boy!" said Winslow. "The worst thing about the whole strike is that it caused so much bitterness between neighbors. The strike is over, and they ought to let by-gones be by-gones."

(Continued next week)

UNION CARBIDE

In mansion
farmhouse
or cottage

The first house to be lighted by Carbide-gas, thirty years ago, and still lighted by this means.

THIS BEAUTIFUL HOME at Greenwich, Connecticut, was the first house to be lighted by Carbide-gas; and now, after thirty years, Carbide-gas still lights this mansion.

There are many homes throughout the country, the owners of which could afford, and could get any kind of lighting they might wish—yet they prefer Carbide-gas because of the superiority of its light.

"Artificial sunlight" is the name frequently given to Carbide-gas light because scientific analysis proves that it has more of the color ingredients and quality of actual daylight than any other artificial illuminant.

Yet, in spite of its superiority, a Carbide-gas plant is well within the means of any farm owner. This is made plain by the fact that during the past twenty-five years 409,000 of these plants have been installed on farms all over the country.

The modern farmer realizes that to be efficient and to make the greatest income, he must have modern equipment. He buys farm machinery because he knows it will save money in the end.

And he buys a Carbide-gas plant for his home and farm buildings because good light saves much time in early morning and late evening work, as well as reducing household tasks by making it unnecessary to clean and fill lamps.

The modern farmer's wife also makes her duties easier and more pleasant by cooking and ironing with Union Carbide-gas.

The entire family benefits from the comfort and convenience of good light, which prevents eyestrain and encourages reading and wholesome home life.

Union Carbide-gas is made in a simple automatic generator which brings the Union Carbide into contact with water in the proper proportions. From this generator the gas is carried in iron pipes throughout house, barn, grounds and poultry buildings.

Union Carbide itself is a crystalline material, in general appearance like crushed granite. It is supplied in generators sizes direct to the consumer at factory prices through 175 Union Carbide warehouses. There is one near you.

During the past 25 years, Carbide-gas lighting has been installed in more than 409,000 farm and country homes all over the country.

Easter Games

Vary the Egg Race and the Egg Hunt

PLACE six hard boiled Easter eggs on each side of the room, about one foot apart. A large basket is placed at the far end of the room. The players are divided into two sides, each side being chosen one at a time by the leaders. A large wooden or tin spoon is then given, to one player on each side, who at a given signal, dishes up the eggs one at a time, with the spoon, placing them in the basket provided. The leader replaces the eggs on the floor, and the next player on each side takes the spoon and lifts the eggs from the floor and carries them to the basket, and so on until all have had a turn.

A record is kept of the winners and the side having the greatest number wins the game. This game maybe changed slightly by some one timing the players, keeping track of the seconds and the one getting all the eggs into the basket in the shortest time receives a prize.

or paper bag and at a signal they start to hunt for the hidden eggs. Allow a certain length of time for the hunting, and reward the one who finds the most eggs with a large candy egg.

Another amusing hour can be spent in having the guests write all the words possible out of the word Easter, also to write all the different kinds of lilies they know. Suitable Easter prizes can be given for the best ones written.

Another feature for an Easter holiday party would be to provide all the children with two or three hard-boiled eggs. Furnish the guests with paints, and brushes or crayons, and ask them to color and decorate the eggs to their liking. This would call for a prize, to be awarded to the one entering the most artistic and prettily decorated egg in the contest. This egg painting contest will provide much entertainment and will be interesting to little folks.

Attractive Dresses For Miss and Adult

Before the summer work is in full swing, now is the time to get the dressmaking out of the way. The styles shown here are suitable for young daughter, for the high school or college girl and for the matronly figure. Our patterns are made by leading designers in New York City and are guaranteed to fit perfectly. If you wish to see other designs for this season, order our Fashion Catalogue (price 10c).

This new jumper dress pattern No. 2412 cuts in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 1½ yards 40-inch material for dress and 2½ yards 40-inch material for guimpe. For the skirt and suspenders kasha, flannel, heavy silk or cotton goods would be suitable, while flat silk crepe, or voile make a becoming contrast for the blouse. Pattern, 12c.

No. 2392 looks well when made of printed silk, novelty cotton, pongee or fine lawn. The pattern cuts in sizes 6, 8, 10, 12 and 14 years. For the 8-year size, 1½ yards of 40-inch material with ¾ yard of 30-inch contrasting are required. Pattern 12c.

2392

No. 2403, is a most fortunate design for those who wish to conceal rather than emphasize "to plumpness." A fine twill, kasha, ribbed silk, crepe de chine, wool or silk poplin might be used for pattern No. 2403, which comes in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 2½ yards of 42-inch material with ¾ yard of 27-inch contrasting. Pattern, 12c.

2403

TO ORDER: Write name, address, pattern numbers and sizes clearly and correctly. Enclose remittance in stamps or coin (coin sent at own risk) and mail to the Pattern Department, AMERICAN AGRICULTURIST, 461 4th Ave., New York City.

When it is convenient to play this game out of doors, or in a very large room, place six or more rows of six eggs each on each side of the room or lawn, with a player (provided with a spoon) behind each row. At a given signal all start to pick up the eggs with their spoons and the one finishing first wins for his side.

An Egg Hunt.

Hide colored Easter eggs, or small candy eggs in various places, in corners, behind curtains, bric-a-brac, etc. Provide each child with a small basket

Calla Lily Cakes.—Three eggs, one cupful of sugar, one cupful of flour, two tablespoonfuls of cold water, one teaspoonful of baking powder, beat for five minutes. Put one tablespoonful in each round tin, and bake a delicate brown. While hot take out of tin, shape them like a lily. Fill with whipped cream, and in the center arrange a long strip of yellow icing. They are very appropriate, prepared in this way.
—Miss H. A. LYNAN.

When the baby gets new shoes sew the buttons on with silk twist so he can't easily pull them off.

Pleasant Home Holidays

They May Be Made More Pleasant by All Planning Together

FORTUNATE indeed is the man who can remember with the coming of each holiday some delightful occasion of his childhood days, and the proper observance of home holidays lies largely in the mother's hands.

Fortunately we have kept the custom of trimming the Christmas tree, of the Thanksgiving turkey and coloring Easter eggs, but even these are in some sections being crowded out by the community tree and annual egg hunt.

If possible serve the morning meal in the breakfast nook or in the kitchen making it possible to decorate the dining room even to the laying of the table, since we have found that evening is the best time for cooperation of labor.

Across the top of the room or from the chandelier or light dome, radiating in every direction, pin two inch strips of yellow and lavender or pink and pale blue crepe paper, twisting each strip as it is pinned in place.

If possible use an Easter cloth of decorated paper on the table, but if this seems too great an expense, Easter paper napkins cost but little and one can be placed under each plate, and as nappies under the hot dishes. These, of course, are in addition to the regular paper service napkin.

Since the girls are likely to turn the step ladder and the placing of the ceiling decorations over to the boys, they can spend their time with the table and coloring eggs. Some color the eggs several days before Easter, but I prefer the work

done at the last possible moment as even the best of dyes sometimes stain through the shells.

Using crayolas and dull pointed shears the very little children can cut out and color Easter eggs using any fairly good quality of paper. Easter baskets can also

be made and are charming at each plate as the family take their seats for the Easter dinner.

First cut out the basket, using a rather heavy paper, then from bright colored paper or white paper painted or crayola-ed cut small Easter eggs and paste those back of the straight line representing the top

of the basket, and back of those paste Father Rabbit, drawn, colored and cut out, holding in his hand an Easter greeting card.

Mother's part in the Easter work may be the making of tissue paper flowers for the bowl in the center of the table. Jonquils are easily fashioned and so are tulips, and father may contribute some of the largest late apples to be found in the bin, or a gift of oranges or tangerines.

Lest the over-zealous mother take upon herself the entire responsibility of the Easter preparations, a note of warning should be sounded. The joy of decorating, of having a personal part in the work, is the real secret of a memorable home holiday. No child is too small to do his bit and the finding of what each can do and offering needed suggestions or helps is the mother's best work.—L. M. THORNTON.

The Best Spring Tonic

OFTEN a spring tonic seems necessary because we are not wise enough to adapt ourselves to altered weather conditions. We lose our pep and feel as if old age were making a levy on us. In our grandmother's day it was sulphur and molasses—sometimes sassafras tea. Then came the era of patent medicines.

But why all those aches and pains with the coming spring? Because we continue our winter diet—flap jacks and sausages, syrups and gravies, honey and pork and all the other "hearty foods."

Instead of tonics let us eat less and be wise in our selection. Fruits, vegetables and eggs are wonderful rejuvenators. A window, wide open all night, is the king of tonics and spring sunshine works wonders. Air and sunshine are the cheapest medicines in the world. Nobody is too poor to afford them. Give them a trial free.

—MRS. GEORGE GRAY.

An Easy Way of Polishing Stained Silver

FREQUENTLY it happens (in the best regulated families, too) that the supper dishes and silver are left unwashed. The next morning a disorderly, stained mess greets us. Of course, the dishes can easily be cleaned by soaking and washing but the silverware—that seems almost helplessly rusted.

Here is a plan for cleaning and polishing silver in a very easy way. Place a soft towel, in the bottom of a pan; fill the pan half full of cold water, add one teaspoonful of washing soda, a small square of aluminum approximately four inches long and procurable at any plumber's or hardware store. Put the silver in the pan, place the pan over the flame and allow the water to come to a boil.

Remove from flame, rinse with boiling water and dry each piece individually. The silver will fairly sparkle with newness.

—I. R. HEGEL.

Service Department

What About Sugarjack?--Ten Investment Rules

I am a reader of your paper and see countless numbers benefited by your service. Now I am asking your help.

I am sending you the contract between us and "The Ohio Sugar Jack Company" at Wellington, Ohio. The agent for this company told us that shredded fodder was just the thing to use as we had a lot of it. We got no results and now they say we must run it through an ensilage cutter. We only used it two or three days as we considered it of no benefit.

This same agent sold one to a banker at Urbana, Ohio, and the agent told him practically the same thing; about two months ago they came and got it.

This Sugar Jack was to have been wrapped with asbestos which was never done; also there was to have been a weight hook, according to the contract, which we never got.

The agent said that if it did not save use \$150 in two months they would take it out. Now we have written to the company and they refuse to take it out and more than that they say they are not responsible for what he says, although he is their agent. If you can get the full amount of \$350, so much the better; if not, would settle for \$200. F. H. S., Logan Co., Ohio.

WE have received several letters of complaint similar to the above against the Ohio Sugar Jack Company, and as a result have been making a careful investigation of the methods that this company uses in dealing with an increasingly large number of farmers who buy their outfit with the idea of cutting down feed cost.

The Ohio Sugar Jack Company is selling through agents what is known as a Sugar Jack Press, which is nothing more or less than a steel cylinder into which ground roughage is put to the extent of 780 pounds, 20 pounds of malt added, and 1200 pounds of water. It is then left from twelve to twenty-four hours and it is claimed that a wonderful feed is made. The idea claimed for it is to make good feed out of poor roughage. The cylinders are sold at high prices.

We have taken the matter up with feed experts, including Professor E. S. Savage of the Animal Husbandry Department of the New York State College of Agriculture and Professor C. C. Hayden of the Ohio Agricultural Experiment Station. Both of these men say that the claims of the company for Sugar Jack are not borne out by results.

Professor Hayden says:

"About one year ago I took the occasion to visit a number of farms where the process was used or had been in use. Samples collected at these farms and brought to our laboratory did not show that any change had taken place in the material, other than the salting and the soaking.

"In this state (Ohio), the company has been claiming that the carbohydrates were changed to sugars. The analysis of the materials before, and the product after processing, does not show any increase in sugar or any decrease in crude fiber.

"Analysis of the converter showed it to be about 50 per cent ash, the greater part of which was salt.

"I found some men who seemed to be well satisfied with the process; some of them were interested as agents; others had not had much experience in feeding, or were originally poor feeders. I know at least five persons in Ohio who have discarded the process.

"The oil required for heating and other expenses amount to considerable per ton of material.

"At present, I believe that the silo is a much better investment. I do not believe that the material after it passes through this process is much better than it would have been had it been put into the silo in the same way and wet down.

"There is, of course, some advantage in the salting in that it makes the material a little more palatable; and, there may be some advantage in the fact that the feed is warm during cold weather.

"None of the men visited claimed that it required less labor; but they did claim that the labor was better distributed throughout the year.

"It is probable that they can get cattle to consume lower grade feed or feed that is more nearly spoiled than they could without the process. This is of doubtful economical value."

It would seem to us therefore in view of our investigation that while some dairy-men have received some benefit from using this process, yet the benefit was not in proportion with the cost of the outfit.

It also seems to be a fact that many of those who have purchased the cylinder soon became dissatisfied.

Ten Commandments For the Investor and Saver*

- I. Never buy stock in mines you know nothing about.
Remember the saying "A mine is a hole where fools dump their money."
- II. Before you buy oil stock, see your banker.
Better try the horse races—sometimes the horses run—often the oil doesn't.
- III. Don't buy stock in untried inventions.
Most investors and some promoters have good intentions—but you know what is paved with good intentions.
- IV. Buying shore frontage real estate by mail is a very easy way of getting rid of your money.
Sometimes looks well at low tide, but you can only see it at high tide through a glass bottom boat.
- V. Before buying stock in new manufacturing methods, consult an expert.
Take your time.
- VI. "Sleep over" every proposed investment.
Don't crowd. The wild cat stock salesman who says "it may be too late," means it may be too late for him if you investigate first.
- VII. Don't fall for the lure of special "for you only."
What isn't worth much can be freely given away.
- VIII. When somebody whispers that he has a "straight tip."
Put your hands over both ears, and go away from there! You may be "let in" on the ground floor and later crawl out the cellar window under the wreckage.
- IX. Few rich men speculate in stocks that are not on the exchange.
That's why they are rich. Don't think that you know more than they do.
- X. Don't buy stock of a new company just because some other company made a mint of money in the same line.
Ford made a fortune out of the "flivver," don't let a stock salesman make a "flivver" out of your savings.

*From an advertisement of the Savings Bank of Utica.

How To Make Fish Ponds

ONE of our subscribers recently wrote the Service Bureau for some suggestions for making and stocking fish ponds on farms. We wrote to the United States Department of Commerce, Bureau of Fisheries, Washington, D. C., and they sent the subscriber copy of Bulletin No. 826, entitled "Fish Ponds on Farms." If anyone else is interested in establishing fish ponds, we advise that you write the Department of Commerce for one of these very good bulletins. The bulletin is not free, so enclose five cents in stamps to pay for it.

A Doubtful Company

We are obliged to warn our readers against doing business with the Michigan Glass and Fixture Company of Detroit, Michigan. We had a complaint from one of our readers against this company and when we took it up the letter was returned by the Post Office Department with the notation that no such firm exists in Detroit.

Chart of Recommendations

(Abbreviated Edition)

THE correct grades of Gargoyle Mobiloil for engine lubrication of both passenger cars and motor trucks are specified in the Chart below.

E means Gargoyle Mobiloil "E"

How to Arc means Gargoyle Mobiloil Arctic

Read the A means Gargoyle Mobiloil "A"

Chart: B means Gargoyle Mobiloil "B"

BB means Gargoyle Mobiloil "BB"

Where different grades are recommended for summer and winter use, the winter recommendation should be followed during the entire period when freezing temperatures are experienced.

The Chart of Recommendations is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and represents our professional advice on correct automobile lubrication.

Transmission and Differential

For their correct lubrication, use Gargoyle Mobiloil "C," "CC" or Mobililubricant as recommended by complete Chart available at all dealers.

What is your Margin of Safety?

No GOOD BRIDGE is built without providing an ample margin of safety. No skyscraper is erected without allowing a margin of safety. No good automobile is designed without making sure that there is a margin of safety in all those parts which must withstand severe strains.

No lubricating oil should be used in your automobile engine which does not provide an ample margin of safety. Unusual strains are sure to come—demands of cold weather which congeals unsuitable oil, the added heat of a hard pull in low gear through snow or mud, the added friction of a necessary spurt of speed. Even the most careful drivers run into these conditions.

It is then that the difference between haphazard lubrication and Gargoyle Mobiloil, with its greater margin of safety, may mean

- the difference between a burned out bearing—or a protected bearing
- the difference between a damaged engine—or a protected engine
- the difference between excessive carbon—or infrequent carbon
- the difference between dangerous frictional heat—or minimized frictional heat.

When you use the grade of Gargoyle Mobiloil specified for your car, you secure the fullest possible margin of safety in the operation of your automobile engine. For no other automobile oil has back of it such specialized manufacturing experience and success.

That is why practically every automobile manufacturer endorses the Gargoyle Mobiloil recommendation for your car in the Chart of Recommendations.

That is why Gargoyle Mobiloil is asked for by name at least five times as often as any other oil.

If you want the greatest margin of safety in the lubrication of your automobile engine, you want Gargoyle Mobiloil—the grade recommended for your car.

TRACTOR Lubrication

The correct engine lubrication for the Fordson Tractor is Gargoyle Mobiloil "BB" in summer and "A" in winter. The correct oil for all other tractors is specified in our chart. Ask for it at your dealer's.

Why and How I Plow

The Kind of Plowhandle Talk Our Readers Watch For

By H. E. COOK

I HAVE studied and queried for a long time, why it is that most of us on dairy farms do not plow, till and care for our fallow land better. In my observation very little is accomplished with any of us looking toward betterment of any sort by discussing methods until we have the spirit and desire worked into our being and we become ambitious to accomplish that particular thing.

H. E. COOK

Hills are not removed, nor quack grass killed by reading scientific essays on methods. We must first be made to feel the necessity of moving the obstruction and of freeing our land of the mischievous plants. We shall then be seeking out the best method at the least cost, and so we must feel the spiritual need of changing the quack roots for clover roots. If we are to plow deeper and cultivate more thoroughly, a discussion of what type or make of plow and harrow at the outset will be wasted, and time, paper and ink and all of the detail of grinding out matter, getting it into a paper and reading the stuff will be lost energy.

Love for our business and pride in its execution is the basic cause for betterments. As previously said, our spiritual natures must first be touched. Maybe you don't agree and feel rather that it is economic and that our first impulse is to get more revenue, from which we can buy another thing, or invest in stock, or buy a higher priced cow. But that is not an observation. I notice that farmers who are always intent on the dollar are inclined to get the last available pound of plant food into cash and have no pride or joy in a beautiful field into which he has put his soul, mind and body.

This beautiful transformation will never appear until it first de-

velops in the mind of the doer as a work of art. Facts are, of course, that profits will eventually come if the work has been judiciously done by a business mind that reckons with getting value received for labor performed, always working with nature, not setting up artificial conditions of performance. To illustrate—if we want to trade quack roots for clover roots in a dry season which means we must not only kill the quack but decompose the plant into humus to hold moisture, which shall not interfere with the germination of clover seed, but shall feed the tiny plants, we shall find straightway that we have mainly succeeded in having the first six inches of soil and the surface of the ground, filled and covered with roots with just enough life left in them to grow again when rain comes and we quit our job. Art alone won't get a fellow far without some practical every day working judgment unless he has more extra money than is possessed by the general average of working farmers in the East.

Supposing now we have this vision—how shall we begin. The land will have to be plowed, by what kind of a plow? Really I don't know. I expect most of us will use the one we have. The depth will depend, if former plowing has been shallow, I would not go more than one inch deeper if the subsoil is heavy and maybe a little deeper if lighter.

Probably the number of times we plow and the frequency of cultivation will have a lot more to do with our success than the depth, although moderately deep plowing, say eight inches, finally will be helpful. If we must have extremes, let us have shallow plowing with ideal protracted harrowing rather than deep plowing with indifferent harrowing.

What are we trying to do anyhow, in this operation? We want to get whatever organic matter there may be in the surface soil turned back to humus in the shortest possible time. We want to mix the particles of soil into a changed relationship to promote the chemicalization of plant food; that is, make it soluble, get more air into a compact soil and crowd out air from a loose soil, increase bacterial growth by a combination of humus, water and heat and provide a water retaining mulch on the surface.

This can be done to suit the doer. Maybe the springtime with a late planted crop maybe the summer time, like an old time summer fallow; maybe in the fall, after a crop has come off. Don't let us be serious about the time, but let us be tenacious about getting the results. High cost harrows have been made and they are good, but man has not yet made a tillage tool like the plow if used often enough. For our soils, a plow and a disk harrow make the combination. Plow more than once, yes, maybe twice and perhaps three times, using harrows in the meantime for loamy soil will make a garden. I have no

brief for sticky clay—I have taken a quacky sod in the spring, plowed three times with harrowing in time to set cabbage and cared for the cabbage with two days' work for a man per acre.

I don't think this short time treatment is always the most economical. Part of the work could be more cheaply done in the fall. When I was a boy, good plowing was straight furrows which is just as necessary as it ever was in clay, where drainage is secured on the surface by open or dead furrows, but other-

GOOD TILLAGE REQUIRES GOOD POWER

Over 200,000 Delco-Light Plants are equipped with Delco- Light Exide Batteries

THE storage battery is the heart of a farm electric plant. In the battery is stored the energy generated by the engine and dynamo.

If it were not for the battery, the plant would have to run every time you wanted to use even a single light.

Delco-Light, leader in the field of farm lighting, selects the best storage batteries so that Delco-Light plant owners may store power most efficiently, saving fuel and obtaining electric light and power at lowest possible cost.

The 200,000 Delco-Light plants, that mean so much to farm homes, schools, and churches in rural communities, are all equipped with Delco-Light Exide Batteries, especially designed for this important service.

Known for a generation as the *long-life battery*, Exides are built by the world's largest manufacturers of storage batteries for every purpose. They are rugged, dependable, and economical.

What Readers Want To Know

Popcorn For Market and Other Timely Questions

TO obtain best results pop corn should be used in conjunction with the regular plan of crop rotation. Following one or two years planting of field corn with this crop is an excellent arrangement. To successfully grow and advantageously market pop corn requires fully as much work as any other crop, but the returns are usually better than most staple crops and are seldom disappointing. It requires some experience to market this product properly. For this reason it is well to begin on a small scale, then if the work is found agreeable and successful the size of the business can be increased.

It is a good custom to have the crop contracted for before it is planted, then there is no disappointment from lack of sale should the market be glutted with the product.

Choice Variety Is Important

The varieties to plant are important. Because of the number of varieties and the different names applied to each sort it is sometimes rather confusing to determine the best kind to grow. White rice is a well known variety and an old favorite. The so-called Australian hull-less is also good, having desirable popping qualities there being no unpleasant hull left when popped. The baby rice is no doubt the best seller and popper, though more difficult to harvest and not so prolific in yield as the other two named.

Pop corn should be planted as early as is safe. It may be drilled in rows the same as field corn using planter plates with 3-8 inch holes. Cultivation is of course similar to that of field corn. However, a little extra care must be observed to prevent covering when the plants are small, and to throw the soil up around the corn just as soon as it can be done, to prevent suckering.

Mixes Readily With Field Corn

Pop corn mixes readily with field corn, this fact should be kept in mind when locating the pop corn field. All field corn or other strains of pop corn that appear in the field, should be detasseled or cut off at the root to retain the purity of the variety. Often pop corn is cut for fodder and the corn is later shucked from the shock. But corn matured and dried on the stalk is superior to shock-dried corn, both for seed and popping purposes. The fodder, however, makes a valuable feed and can be saved after the corn is gathered.

The corn should be husked promptly when in shape and stored in a rat and mouse-proof crib. A steel crib is eminently good for storing pop corn and if sufficient ventilation is provided the corn will not be long in drying. Seed pop corn that is not sold the first season for seed, can be held for several years, if properly stored, and still retain its popping qualities. Corn should not be used for seed after one year as it soon loses its vitality.

Seed dealers, confection manufacturers and popping vendors that are favorably

located, are all good places to sell when the shelled corn is ready for the table.

Seeding Meadow to Bluegrass

I have a meadow which has not been plowed for many years. I am going to lime and fertilize, and wish to sow a good mixture to get the meadow down in bluegrass. The meadow will be plowed to get it in good condition.—H. D., Maryland.

THE so-called bluegrass and white clover type of pasture should meet your conditions and prove satisfactory if the soil is fairly productive and well limed.

Mixtures found satisfactory under general conditions—assuming that the soil is well supplied with plant food and well limed—fall under the classification of: When field is to be hayed one or two years, then pastured; and when field is not to be hayed at all but seeded for pasture only.

In the former case, where the field will be hayed for a year or two, the following mixture is very satisfactory: Timothy, 8 pounds; red clover, alsike clover, Kentucky bluegrass, white clover, redtop and orchard grass, 2 pounds each, making a total of 20 pounds. Where pasture only is desired, the following mixture is desirable: Timothy, 4 pounds; alsike clover, Kentucky bluegrass, white clover, orchard grass, redtop and meadow fescue, 2 pounds each, or a total of 16 pounds.

Sowing Alfalfa Alone

Can alfalfa be sown as soon as the ground can be gotten into shape, or should it be sown later?

It should be sown later. This is necessary in order to make sure that the weeds are conquered. Clean ground is absolutely necessary. Therefore, it is well to wait long enough so that there is opportunity for harrowing the ground once a week for several weeks in order to get rid of the weeds. Some authorities advise a thin nursing crop such as oats or barley to be sown with alfalfa when it is sown in the spring.

Best Varieties of Early Potatoes

I want to raise some early potatoes this year. What varieties are best for market?

In AMERICAN AGRICULTURIST territory, Irish Cobblers head the list of best varieties of early potatoes and are the most generally used. There is a red variety called Bliss which does well in some sections and some growers have good results with Early Ohio.

Dry Seed Corn

Will seed corn on the cob get too dry to grow?

No. Moisture is the chief cause of trouble in seed corn. If corn is not thoroughly dried before freezing, its germinating power will be injured.
